

## **Advanced Machine Learning** Lecture 13

#### **Convolutional Neural Networks**

15.12.2016

Bastian Leibe **RWTH Aachen** http://www.vision.rwth-aachen.de/

leibe@vision.rwth-aachen.de

#### This Lecture: Advanced Machine Learning Regression Approaches Linear Regression Regularization (Ridge, Lasso) Kernels (Kernel Ridge Regression) Gaussian Processes Approximate Inference Sampling Approaches MCMC Deep Learning Linear Discriminants Neural Networks

### **Topics of This Lecture**

- · Tricks of the Trade
  - Recap
- Convolutional Neural Networks
  - > Neural Networks for Computer Vision
  - Convolutional Layers
  - Pooling Layers
- CNN Architectures
  - LeNet
  - AlexNet
  - VGGNet
  - GoogLeNet

# Recap: Choosing the Right Learning Rate

#### Convergence of Gradient Descent

Backpropagation & Optimization

CNNs, RNNs, ResNets, etc.

> Simple 1D example

$$W^{(\tau-1)} = W^{(\tau)} - \eta \frac{\mathrm{d}E(W)}{\mathrm{d}W}$$

> What is the optimal learning rate  $\eta_{\mathrm{opt}}$ ?

 $\,\,\,\,\,\,\,\,\,$  If E is quadratic, the optimal learning rate is given by the inverse of the Hessian

$$\eta_{\text{opt}} = \left(\frac{\mathrm{d}^2 E(W^{(\tau)})}{\mathrm{d}W^2}\right)^{-1}$$

Advanced optimization techniques try to approximate the Hessian by a simplified form.

If we exceed the optimal learning rate, bad things happen!

this point!

Don't go beyond

# Recap: Advanced Optimization Techniques

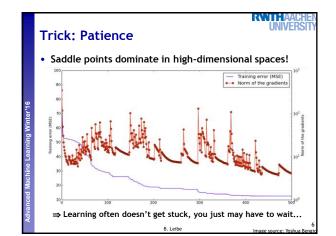

- Momentum
  - Instead of using the gradient to change the position of the weight "particle", use it to change the velocity.
  - Effect: dampen oscillations in directions of high

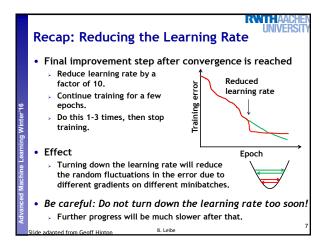

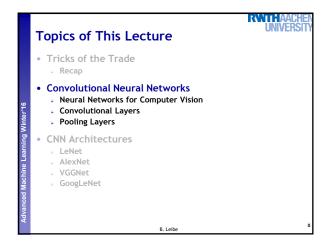

- > Nesterov-Momentum; Small variation in the implementation
- RMS-Prop
  - Separate learning rate for each weight: Divide the gradient by a running average of its recent magnitude.
- AdaGrad
- AdaDelta

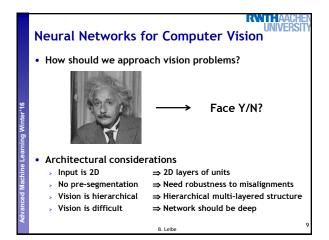

Some more recent techniques, work better for some problems. Try them.

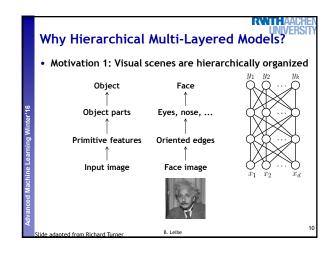

Adam

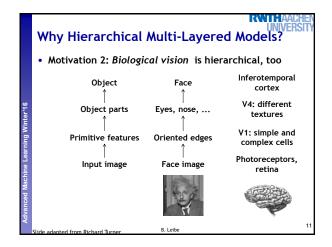

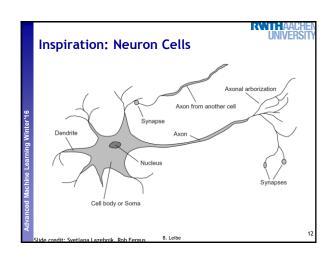

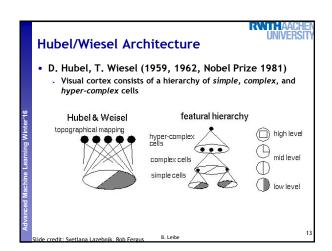

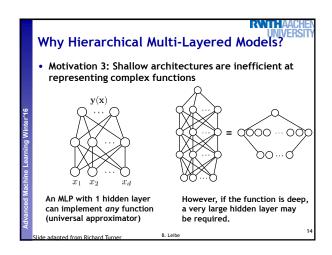

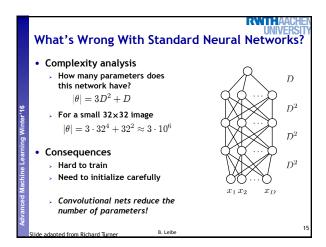

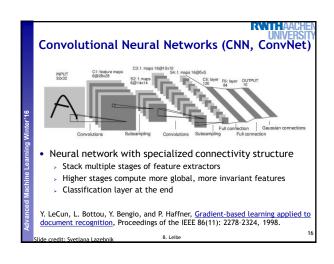

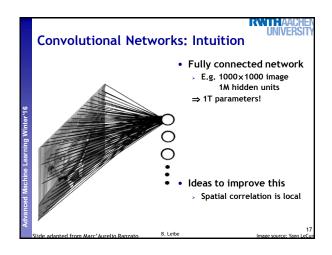

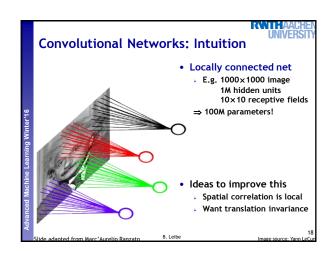

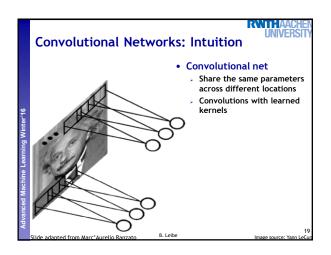

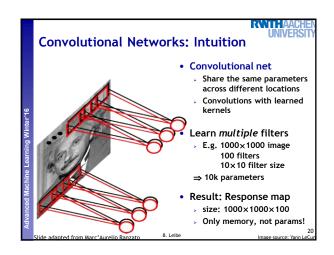

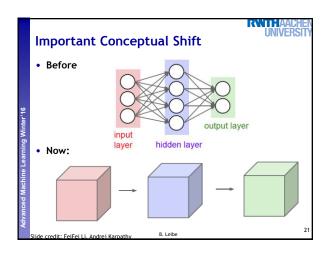

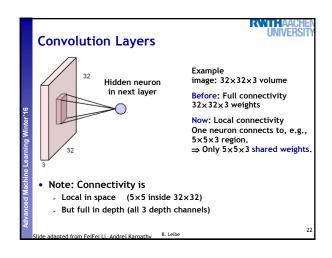

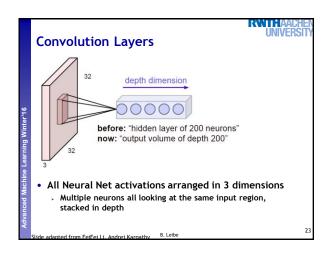

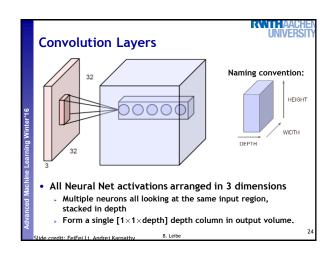

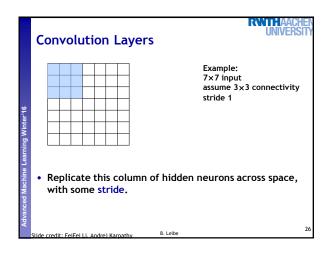

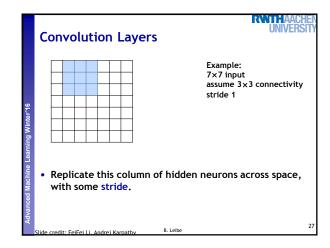

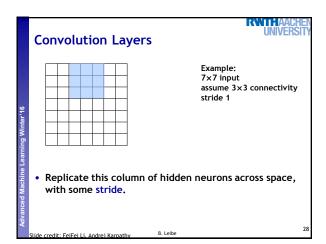

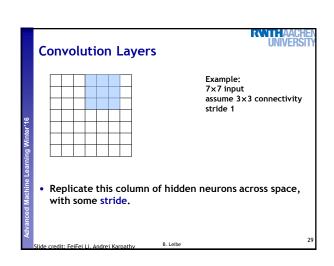

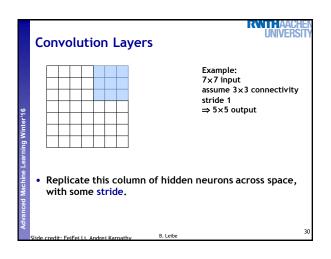

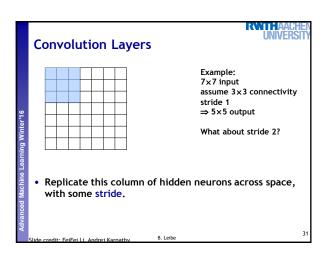

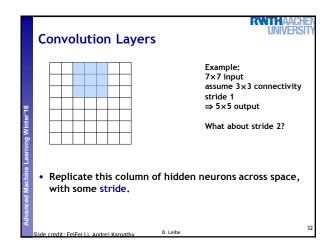

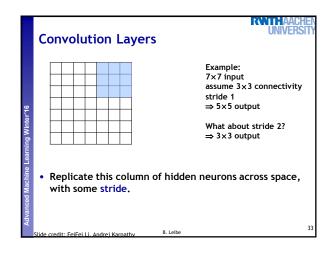

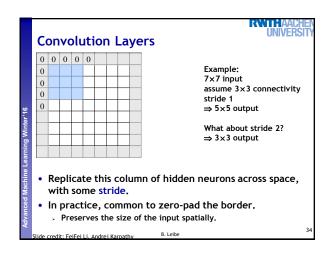

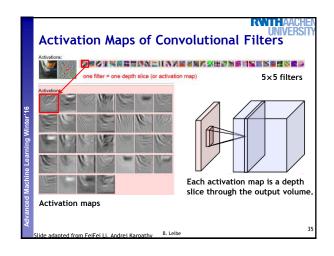

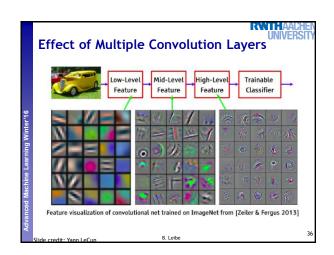

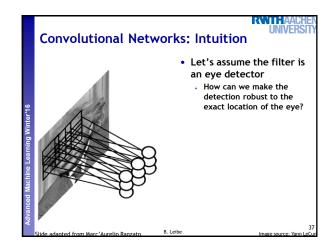

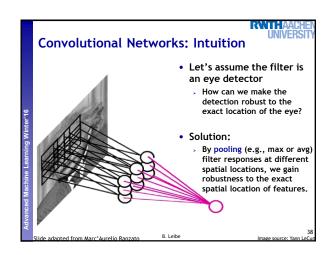

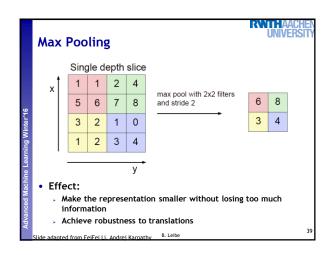

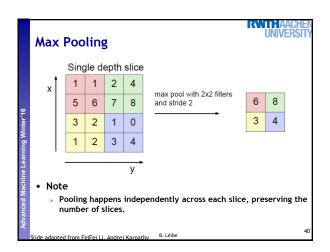

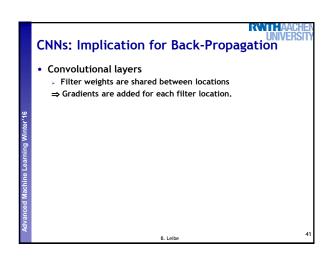

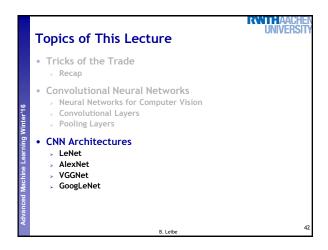

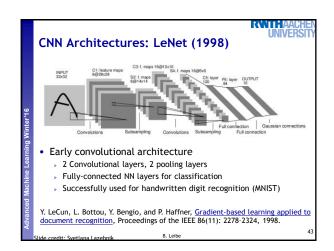

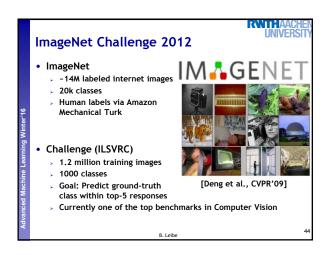

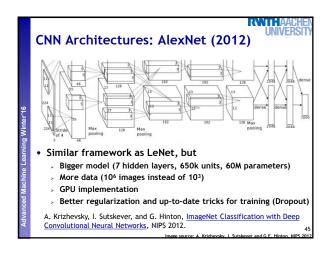

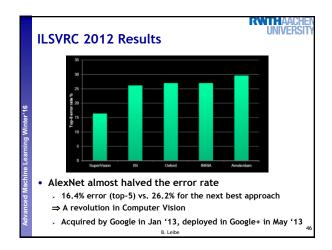

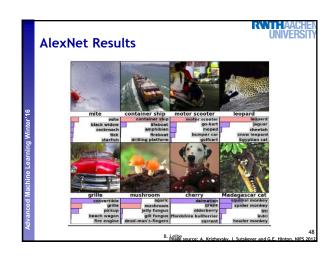

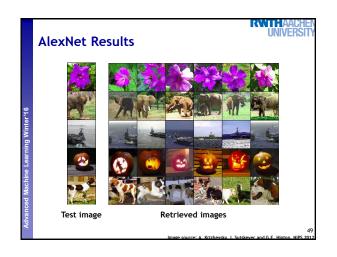

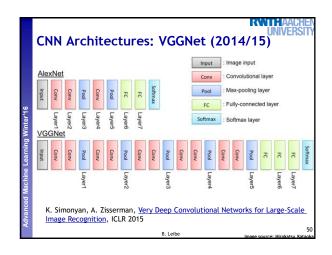

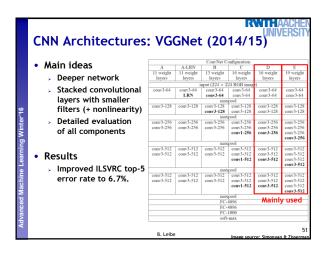

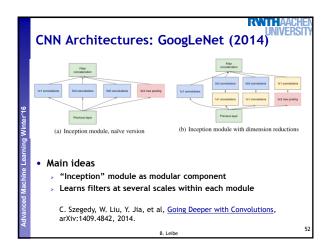

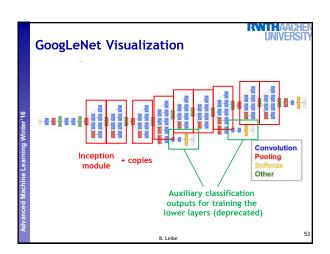

Method		top-5 val. error (%)	
VGG (2 nets, multi-crop & dense eval.)	23.7	6.8	6.8
VGG (1 net, multi-crop & dense eval.)	24.4	7.1	7.0
