Machine Learning Winter '17

RWTH AACHEN
UNIVERSITY

Announcements

- Exceptional number of lecture participants this year
 - Current count: 449 participants
 - This is very nice, but it stretches our resources to their limits
- Monday lecture slot
 - Shifted to 8:30 – 10:00 in AH IV (276 seats)
 - We will monitor the situation and take further action if the space is not sufficient
- Thursday lecture slot
 - Will stay at 14:15 – 15:45 in H02 (C.A.R.L, 786 seats)
- Exercises (non-mandatory)
 - We will try to offer corrections, but we will have to see how to handle those numbers...

B. Leibe 2

RWTH AACHEN
UNIVERSITY

Announcements

- L2P electronic repository
 - Slides, exercises, and supplementary material will be made available here
 - Lecture recordings will be uploaded 2-3 days after the lecture
- Course webpage
 - <http://www.vision.rwth-aachen.de/courses/>
 - Slides will also be made available on the webpage
- Please subscribe to the lecture on the Campus system!
 - Important to get email announcements and L2P access!

B. Leibe 3

RWTH AACHEN
UNIVERSITY

Course Outline

- Fundamentals
 - Bayes Decision Theory
 - Probability Density Estimation
- Classification Approaches
 - Linear Discriminants
 - Support Vector Machines
 - Ensemble Methods & Boosting
 - Randomized Trees, Forests & Ferns
- Deep Learning
 - Foundations
 - Convolutional Neural Networks
 - Recurrent Neural Networks

B. Leibe 4

RWTH AACHEN
UNIVERSITY

Topics of This Lecture

- Bayes Decision Theory
 - Basic concepts
 - Minimizing the misclassification rate
 - Minimizing the expected loss
 - Discriminant functions
- Probability Density Estimation
 - General concepts
 - Gaussian distribution
- Parametric Methods
 - Maximum Likelihood approach
 - Bayesian vs. Frequentist views on probability

B. Leibe 5

RWTH AACHEN
UNIVERSITY

Bayes Decision Theory

Thomas Bayes, 1701-1761

"The theory of inverse probability is founded upon an error, and must be wholly rejected."

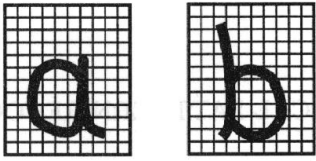

R.A. Fisher, 1925

B. Leibe 14
Image source: Wikipedia

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

- Example: handwritten character recognition

- Goal:
 - Classify a new letter such that the probability of misclassification is minimized.

15

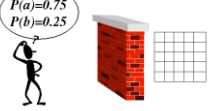

Machine Learning Winter '17 | Slide credit: Bernt Schiele | B. Leibe | Image source: C.M. Bishop, 2006

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

- Concept 1: **Priors** (a priori probabilities) $p(C_k)$
 - What we can tell about the probability *before seeing the data*.
 - Example:

$p(a)=0.75$
 $p(b)=0.25$

?

$C_1 = a$
 $C_2 = b$

$p(C_1) = 0.75$
 $p(C_2) = 0.25$

- In general: $\sum_k p(C_k) = 1$

16

Machine Learning Winter '17 | Slide credit: Bernt Schiele | B. Leibe

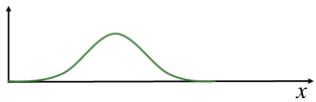

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

- Concept 2: **Conditional probabilities** $p(x|C_k)$
 - Let x be a feature vector.
 - x measures/describes certain properties of the input.
 - E.g. number of black pixels, aspect ratio, ...
 - $p(x|C_k)$ describes its **likelihood** for class C_k .

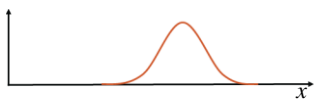

$p(x|a)$

$p(x|b)$

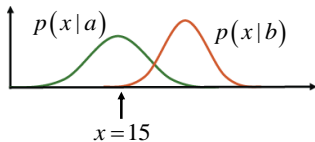

17

Machine Learning Winter '17 | Slide credit: Bernt Schiele | B. Leibe

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

- Example:

$x = 15$
- Question:
 - Which class?
 - Since $p(x|b)$ is much smaller than $p(x|a)$, the decision should be 'a' here.

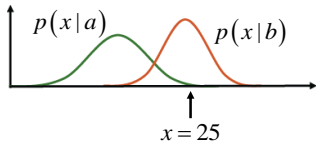

18

Machine Learning Winter '17 | Slide credit: Bernt Schiele | B. Leibe

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

- Example:

$x = 25$
- Question:
 - Which class?
 - Since $p(x|a)$ is much smaller than $p(x|b)$, the decision should be 'b' here.

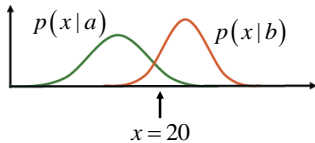

19

Machine Learning Winter '17 | Slide credit: Bernt Schiele | B. Leibe

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

- Example:

$x = 20$
- Question:
 - Which class?
 - Remember that $p(a) = 0.75$ and $p(b) = 0.25$...
 - I.e., the decision should be again 'a'.
 - ⇒ How can we formalize this?

20

Machine Learning Winter '17 | Slide credit: Bernt Schiele | B. Leibe

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

- Concept 3: **Posterior probabilities** $p(C_k | x)$
 - We are typically interested in the *a posteriori* probability, i.e. the probability of class C_k given the measurement vector x .
- Bayes' Theorem:

$$p(C_k | x) = \frac{p(x | C_k) p(C_k)}{p(x)} = \frac{p(x | C_k) p(C_k)}{\sum_i p(x | C_i) p(C_i)}$$
- Interpretation

$$\text{Posterior} = \frac{\text{Likelihood} \times \text{Prior}}{\text{Normalization Factor}}$$

Machine Learning Winter '17 21

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

Machine Learning Winter '17 22

Slide credit: Bernt Schiele B. Leibe

RWTH AACHEN UNIVERSITY

Bayesian Decision Theory

- Goal: **Minimize the probability of a misclassification**

Machine Learning Winter '17 23

Image source: C.M. Bishop, 2006 B. Leibe

RWTH AACHEN UNIVERSITY

Bayes Decision Theory

- Optimal decision rule
 - Decide for C_1 if

$$p(C_1 | x) > p(C_2 | x)$$
 - This is equivalent to

$$p(x | C_1) p(C_1) > p(x | C_2) p(C_2)$$
 - Which is again equivalent to (**Likelihood-Ratio test**)

$$\frac{p(x | C_1)}{p(x | C_2)} > \underbrace{\frac{p(C_2)}{p(C_1)}}_{\text{Decision threshold } \theta}$$

Machine Learning Winter '17 24

Slide credit: Bernt Schiele B. Leibe

RWTH AACHEN UNIVERSITY

Generalization to More Than 2 Classes

- Decide for class k whenever it has the greatest posterior probability of all classes:

$$p(C_k | x) > p(C_j | x) \quad \forall j \neq k$$

$$p(x | C_k) p(C_k) > p(x | C_j) p(C_j) \quad \forall j \neq k$$
- Likelihood-ratio test

$$\frac{p(x | C_k)}{p(x | C_j)} > \frac{p(C_j)}{p(C_k)} \quad \forall j \neq k$$

Machine Learning Winter '17 25

Slide credit: Bernt Schiele B. Leibe

RWTH AACHEN UNIVERSITY

Classifying with Loss Functions

- Generalization to decisions with a **loss function**
 - Differentiate between the possible decisions and the possible true classes.
 - Example: medical diagnosis
 - Decisions: *sick or healthy* (or: *further examination necessary*)
 - Classes: *patient is sick or healthy*
 - The cost may be asymmetric:

$$\text{loss}(\text{decision} = \text{healthy} | \text{patient} = \text{sick}) \gg \text{loss}(\text{decision} = \text{sick} | \text{patient} = \text{healthy})$$

Machine Learning Winter '17 26

Slide credit: Bernt Schiele B. Leibe

RWTH AACHEN UNIVERSITY

Classifying with Loss Functions

- In general, we can formalize this by introducing a loss matrix L_{kj}

$$L_{kj} = \text{loss for decision } C_j \text{ if truth is } C_k.$$

- Example: cancer diagnosis

		Decision	
		cancer	normal
Truth	cancer	0	1000
	normal	1	0

$$L_{\text{cancer diagnosis}} = \begin{matrix} & \text{Truth} \\ & \text{cancer} \\ & \text{normal} \end{matrix} \begin{pmatrix} 0 & 1000 \\ 1 & 0 \end{pmatrix}$$

27

RWTH AACHEN UNIVERSITY

Classifying with Loss Functions

- Loss functions may be different for different actors.

- Example:

	"invest"	"don't invest"	
$L_{\text{stocktrader}}(\text{subprime}) =$	$\begin{pmatrix} -\frac{1}{2}C_{\text{gain}} & 0 \\ 0 & 0 \end{pmatrix}$		

	"invest"	"don't invest"	
$L_{\text{bank}}(\text{subprime}) =$	$\begin{pmatrix} -\frac{1}{2}C_{\text{gain}} & 0 \\ \text{skull} & 0 \end{pmatrix}$		

⇒ Different loss functions may lead to different Bayes optimal strategies.

28

RWTH AACHEN UNIVERSITY

Minimizing the Expected Loss

- Optimal solution is the one that minimizes the loss.
 - But: loss function depends on the true class, which is unknown.
- Solution: **Minimize the expected loss**

$$\mathbb{E}[L] = \sum_k \sum_j \int_{\mathcal{R}_j} L_{kj} p(\mathbf{x}, C_k) d\mathbf{x}$$

- This can be done by choosing the regions \mathcal{R}_j such that

$$\mathbb{E}[L] = \sum_k L_{kj} p(C_k | \mathbf{x})$$

which is easy to do once we know the posterior class probabilities $p(C_k | \mathbf{x})$

29

RWTH AACHEN UNIVERSITY

Minimizing the Expected Loss

- Example:
 - 2 Classes: C_1, C_2
 - 2 Decision: α_1, α_2
 - Loss function: $L(\alpha_j | C_k) = L_{kj}$
- Expected loss (= risk R) for the two decisions:

$$\mathbb{E}_{\alpha_1}[L] = R(\alpha_1 | \mathbf{x}) = L_{11}p(C_1 | \mathbf{x}) + L_{21}p(C_2 | \mathbf{x})$$

$$\mathbb{E}_{\alpha_2}[L] = R(\alpha_2 | \mathbf{x}) = L_{12}p(C_1 | \mathbf{x}) + L_{22}p(C_2 | \mathbf{x})$$
- Goal: Decide such that expected loss is minimized
 - I.e. decide α_1 if $R(\alpha_2 | \mathbf{x}) > R(\alpha_1 | \mathbf{x})$

30

RWTH AACHEN UNIVERSITY

Minimizing the Expected Loss

$$R(\alpha_2 | \mathbf{x}) > R(\alpha_1 | \mathbf{x})$$

$$L_{12}p(C_1 | \mathbf{x}) + L_{22}p(C_2 | \mathbf{x}) > L_{11}p(C_1 | \mathbf{x}) + L_{21}p(C_2 | \mathbf{x})$$

$$(L_{12} - L_{11})p(C_1 | \mathbf{x}) > (L_{21} - L_{22})p(C_2 | \mathbf{x})$$

$$\frac{(L_{12} - L_{11})}{(L_{21} - L_{22})} > \frac{p(C_2 | \mathbf{x})}{p(C_1 | \mathbf{x})} = \frac{p(\mathbf{x} | C_2)p(C_2)}{p(\mathbf{x} | C_1)p(C_1)}$$

$$\frac{p(\mathbf{x} | C_1)}{p(\mathbf{x} | C_2)} > \frac{(L_{21} - L_{22})p(C_2)}{(L_{12} - L_{11})p(C_1)}$$

⇒ Adapted decision rule taking into account the loss.

31

RWTH AACHEN UNIVERSITY

The Reject Option

- Classification errors arise from regions where the largest posterior probability $p(C_k | \mathbf{x})$ is significantly less than 1.
 - These are the regions where we are relatively uncertain about class membership.
 - For some applications, it may be better to reject the automatic decision entirely in such a case and e.g. consult a human expert.

32

RWTH AACHEN UNIVERSITY

Discriminant Functions

- Formulate classification in terms of comparisons
 - Discriminant functions

$$y_1(x), \dots, y_K(x)$$
 - Classify x as class C_k if

$$y_k(x) > y_j(x) \quad \forall j \neq k$$
- Examples (Bayes Decision Theory)

$$y_k(x) = p(C_k|x)$$

$$y_k(x) = p(x|C_k)p(C_k)$$

$$y_k(x) = \log p(x|C_k) + \log p(C_k)$$

Machine Learning Winter '17 33

Slide credit: Bernt Schiele B. Leibe

RWTH AACHEN UNIVERSITY

Different Views on the Decision Problem

- $y_k(x) \propto p(x|C_k)p(C_k)$
 - First determine the class-conditional densities for each class individually and separately infer the prior class probabilities.
 - Then use Bayes' theorem to determine class membership.
 \Rightarrow *Generative methods*
- $y_k(x) = p(C_k|x)$
 - First solve the inference problem of determining the posterior class probabilities.
 - Then use decision theory to assign each new x to its class.
 \Rightarrow *Discriminative methods*
- Alternative
 - Directly find a discriminant function $y_k(x)$ which maps each input x directly onto a class label.

RWTH AACHEN UNIVERSITY

Probability Density Estimation

- Up to now
 - Bayes optimal classification
 - Based on the probabilities $p(\mathbf{x}|C_k)p(C_k)$
- How can we estimate (=learn) those probability densities?
 - Supervised training case: data and class labels are known.
 - Estimate the probability density for each class C_k separately:

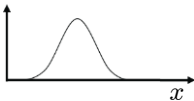

$$p(\mathbf{x}|C_k)$$
 - (For simplicity of notation, we will drop the class label C_k in the following.)

Machine Learning Winter '17 36

Slide credit: Bernt Schiele B. Leibe

RWTH AACHEN UNIVERSITY

The Gaussian (or Normal) Distribution

- One-dimensional case
 - Mean μ
 - Variance σ^2
$$\mathcal{N}(x|\mu, \sigma^2) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left\{-\frac{(x-\mu)^2}{2\sigma^2}\right\}$$

- Multi-dimensional case
 - Mean μ
 - Covariance Σ
$$\mathcal{N}(\mathbf{x}|\mu, \Sigma) = \frac{1}{(2\pi)^{D/2}|\Sigma|^{1/2}} \exp\left\{-\frac{1}{2}(\mathbf{x}-\mu)^T \Sigma^{-1}(\mathbf{x}-\mu)\right\}$$

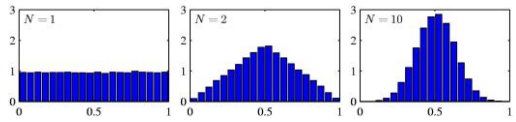

Machine Learning Winter '17 38

B. Leibe Image source: C.M. Bishop, 2006

RWTH AACHEN UNIVERSITY

Gaussian Distribution – Properties

- **Central Limit Theorem**
 - “The distribution of the sum of N i.i.d. random variables becomes increasingly Gaussian as N grows.”
 - In practice, the convergence to a Gaussian can be very rapid.
 - This makes the Gaussian interesting for many applications.
- **Example: N uniform [0,1] random variables.**

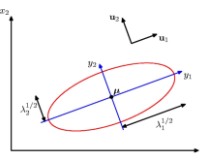

39
B. Leibe Image source: C.M. Bishop, 2006

RWTH AACHEN UNIVERSITY

Gaussian Distribution – Properties

- **Quadratic Form**
 - \mathcal{N} depends on \mathbf{x} through the exponent
 - $$\Delta^2 = (\mathbf{x} - \boldsymbol{\mu})^T \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu})$$
 - Here, Δ is often called the **Mahalanobis distance** from \mathbf{x} to $\boldsymbol{\mu}$.
- **Shape of the Gaussian**
 - $\boldsymbol{\Sigma}$ is a real, symmetric matrix.
 - We can therefore decompose it into its eigenvectors
 - $$\boldsymbol{\Sigma} = \sum_{i=1}^D \lambda_i \mathbf{u}_i \mathbf{u}_i^T \quad \boldsymbol{\Sigma}^{-1} = \sum_{i=1}^D \frac{1}{\lambda_i} \mathbf{u}_i \mathbf{u}_i^T$$
 - and thus obtain $\Delta^2 = \sum_{i=1}^D \frac{y_i^2}{\lambda_i}$ with $y_i = \mathbf{u}_i^T (\mathbf{x} - \boldsymbol{\mu})$
 - ⇒ **Constant density on ellipsoids** with main directions along the eigenvectors \mathbf{u}_i , and scaling factors $\sqrt{\lambda_i}$

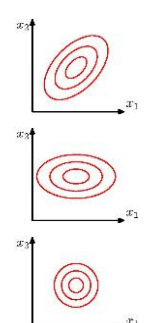

40
Machine Learning Winter '17 Image source: C.M. Bishop, 2006

RWTH AACHEN UNIVERSITY

Gaussian Distribution – Properties

- **Special cases**
 - Full covariance matrix
 $\boldsymbol{\Sigma} = [\sigma_{ij}]$
⇒ General ellipsoid shape
 - Diagonal covariance matrix
 $\boldsymbol{\Sigma} = \text{diag}\{\sigma_i\}$
⇒ Axis-aligned ellipsoid
 - Uniform variance
 $\boldsymbol{\Sigma} = \sigma^2 \mathbf{I}$
⇒ Hypersphere

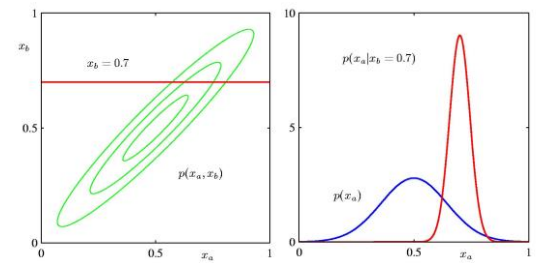

41
B. Leibe Image source: C.M. Bishop, 2006

RWTH AACHEN UNIVERSITY

Gaussian Distribution – Properties

- **The marginals of a Gaussian are again Gaussians:**

42
Machine Learning Winter '17 Image source: C.M. Bishop, 2006

RWTH AACHEN UNIVERSITY

Topics of This Lecture

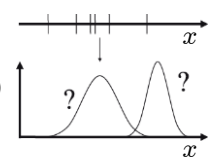

- **Bayes Decision Theory**
 - Basic concepts
 - Minimizing the misclassification rate
 - Minimizing the expected loss

- **Probability Density Estimation**
 - General concepts
 - Gaussian distribution
- **Parametric Methods**
 - Maximum Likelihood approach
 - Bayesian vs. Frequentist views on probability
 - Bayesian Learning

43
B. Leibe

RWTH AACHEN UNIVERSITY

Parametric Methods

- **Given**
 - Data $X = \{x_1, x_2, \dots, x_N\}$
 - Parametric form of the distribution with parameters θ
 - E.g. for Gaussian distrib.: $\theta = (\mu, \sigma)$
- **Learning**
 - Estimation of the parameters θ
- **Likelihood of θ**
 - Probability that the data X have indeed been generated from a probability density with parameters θ
 - $$L(\theta) = p(X|\theta)$$

44
Machine Learning Winter '17 Slide adapted from Bernt Schiele B. Leibe

RWTH AACHEN UNIVERSITY

Maximum Likelihood Approach

- Computation of the likelihood
 - Single data point: $p(x_n|\theta) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left\{-\frac{(x-\mu)^2}{2\sigma^2}\right\}$
 - Assumption: all data points are independent

$$L(\theta) = p(X|\theta) = \prod_{n=1}^N p(x_n|\theta)$$

- Log-likelihood

$$E(\theta) = -\ln L(\theta) = -\sum_{n=1}^N \ln p(x_n|\theta)$$

- Estimation of the parameters θ (Learning)
 - Maximize the likelihood
 - Minimize the negative log-likelihood

45

RWTH AACHEN UNIVERSITY

Maximum Likelihood Approach

- Likelihood: $L(\theta) = p(X|\theta) = \prod_{n=1}^N p(x_n|\theta)$
- We want to obtain $\hat{\theta}$ such that $L(\hat{\theta})$ is maximized.

46

RWTH AACHEN UNIVERSITY

Maximum Likelihood Approach

- Minimizing the log-likelihood
 - How do we minimize a function?
 - ⇒ Take the derivative and set it to zero.

$$\frac{\partial}{\partial \theta} E(\theta) = -\frac{\partial}{\partial \theta} \sum_{n=1}^N \ln p(x_n|\theta) = -\sum_{n=1}^N \frac{\frac{\partial}{\partial \theta} p(x_n|\theta)}{p(x_n|\theta)} \stackrel{!}{=} 0$$

- Log-likelihood for Normal distribution (1D case)

$$E(\theta) = -\sum_{n=1}^N \ln p(x_n|\mu, \sigma)$$

$$= -\sum_{n=1}^N \ln \left(\frac{1}{\sqrt{2\pi}\sigma} \exp\left\{-\frac{\|x_n - \mu\|^2}{2\sigma^2}\right\} \right)$$

47

RWTH AACHEN UNIVERSITY

Maximum Likelihood Approach

- Minimizing the log-likelihood

$$\frac{\partial}{\partial \mu} E(\mu, \sigma) = -\sum_{n=1}^N \frac{\frac{\partial}{\partial \mu} p(x_n|\mu, \sigma)}{p(x_n|\mu, \sigma)}$$

$$= -\sum_{n=1}^N \frac{2(x_n - \mu)}{2\sigma^2}$$

$$= \frac{1}{\sigma^2} \sum_{n=1}^N (x_n - \mu)$$

$$= \frac{1}{\sigma^2} \left(\sum_{n=1}^N x_n - N\mu \right)$$

$$\frac{\partial}{\partial \mu} E(\mu, \sigma) \stackrel{!}{=} 0 \quad \Leftrightarrow \quad \hat{\mu} = \frac{1}{N} \sum_{n=1}^N x_n$$

$$p(x_n|\mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{\|x_n - \mu\|^2}{2\sigma^2}}$$

48

RWTH AACHEN UNIVERSITY

Maximum Likelihood Approach

- We thus obtain

$$\hat{\mu} = \frac{1}{N} \sum_{n=1}^N x_n \quad \text{"sample mean"}$$

- In a similar fashion, we get

$$\hat{\sigma}^2 = \frac{1}{N} \sum_{n=1}^N (x_n - \hat{\mu})^2 \quad \text{"sample variance"}$$

- $\hat{\theta} = (\hat{\mu}, \hat{\sigma})$ is the **Maximum Likelihood estimate** for the parameters of a Gaussian distribution.
- This is a very important result.
- Unfortunately, it is wrong...

49

RWTH AACHEN UNIVERSITY

Maximum Likelihood Approach

- Or not wrong, but rather **biased**...
- Assume the samples x_1, x_2, \dots, x_N come from a true Gaussian distribution with mean μ and variance σ^2
 - We can now compute the expectations of the ML estimates with respect to the data set values. It can be shown that

$$\mathbb{E}(\mu_{ML}) = \mu$$

$$\mathbb{E}(\sigma_{ML}^2) = \left(\frac{N-1}{N}\right) \sigma^2$$

⇒ The ML estimate will underestimate the true variance.

- Corrected estimate:

$$\hat{\sigma}^2 = \frac{N}{N-1} \sigma_{ML}^2 = \frac{1}{N-1} \sum_{n=1}^N (x_n - \hat{\mu})^2$$

50

RWTH AACHEN UNIVERSITY

Maximum Likelihood – Limitations

- Maximum Likelihood has several significant limitations
 - It systematically underestimates the variance of the distribution!
 - E.g. consider the case $N = 1, X = \{x_1\}$

⇒ Maximum-likelihood estimate:

- We say ML *overfits to the observed data*.
- We will still often use ML, but it is important to know about this effect.

Machine Learning Winter '17 51

Slide adapted from Bernd Schiele B. Leibe

RWTH AACHEN UNIVERSITY

Deeper Reason

- Maximum Likelihood is a **Frequentist** concept
 - In the **Frequentist view**, probabilities are the frequencies of random, repeatable events.
 - These frequencies are fixed, but can be estimated more precisely when more data is available.
- This is in contrast to the **Bayesian** interpretation
 - In the **Bayesian view**, probabilities quantify the uncertainty about certain states or events.
 - This uncertainty can be revised in the light of new evidence.
- Bayesians and Frequentists do not like each other too well...

Machine Learning Winter '17 52

B. Leibe

RWTH AACHEN UNIVERSITY

Bayesian vs. Frequentist View

- To see the difference...
 - Suppose we want to estimate the uncertainty whether the Arctic ice cap will have disappeared by the end of the century.
 - This question makes no sense in a Frequentist view, since the event cannot be repeated numerous times.
 - In the Bayesian view, we generally have a prior, e.g. from calculations how fast the polar ice is melting.
 - If we now get fresh evidence, e.g. from a new satellite, we may revise our opinion and update the uncertainty from the prior.

$$\text{Posterior} \propto \text{Likelihood} \times \text{Prior}$$

- This generally allows to get better uncertainty estimates for many situations.

- Main Frequentist criticism
- The prior has to come from somewhere and if it is wrong, the result will be worse.

Machine Learning Winter '17 53

B. Leibe

RWTH AACHEN UNIVERSITY

Bayesian Approach to Parameter Learning

- Conceptual shift
 - Maximum Likelihood views the true parameter vector θ to be unknown, but fixed.
 - In Bayesian learning, we consider θ to be a random variable.
- This allows us to use knowledge about the parameters θ
 - i.e. to use a prior for θ
 - Training data then converts this prior distribution on θ into a posterior probability density.

- The prior thus encodes knowledge we have about the type of distribution we expect to see for θ .

Machine Learning Winter '17 54

Slide adapted from Bernd Schiele B. Leibe

RWTH AACHEN UNIVERSITY

Bayesian Learning

- Bayesian Learning is an important concept
 - However, it would lead to far here.
 - ⇒ I will introduce it in more detail in the **Advanced ML lecture**.
