Part 3 – Template-based Tracking 17.10.2018

Prof. Dr. Bastian Leibe

RWTH Aachen University, Computer Vision Group
<http://www.vision.rwth-aachen.de>

Course Outline

- Single-Object Tracking
 - Background modeling
 - Template based tracking
 - Tracking by online classification
 - Tracking-by-detection
- Bayesian Filtering
- Multi-Object Tracking
- Visual Odometry
- Visual SLAM & 3D Reconstruction
- Deep Learning for Video Analysis

Recap: Gaussian Background Model

• Statistical model

- Value of a pixel represents a measurement of the radiance of the first object intersected by the pixel's optical ray.
- With a static background and static lighting, this value will be a constant affected by i.i.d. Gaussian noise.

• Idea

- Model the background distribution of each pixel by a single Gaussian centered at the mean pixel value:

$$\mathcal{N}(\mathbf{x}|\boldsymbol{\mu}, \boldsymbol{\Sigma}) = \frac{1}{(2\pi)^{D/2} |\boldsymbol{\Sigma}|^{1/2}} \exp \left\{ -\frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^T \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu}) \right\}$$

- Test if a newly observed pixel value has a high likelihood under this Gaussian model.

⇒ Automatic estimation of a sensitivity threshold for each pixel.

3

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 – Template based Tracking

Recap: Stauffer-Grimson Background Model

• Idea

- Model the distribution of each pixel by a mixture of K Gaussians

$$p(\mathbf{x}) = \sum_{k=1}^K \pi_k \mathcal{N}(\mathbf{x}|\boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k) \quad \text{where} \quad \boldsymbol{\Sigma}_k = \sigma_k^2 \mathbf{I}$$

- Check every new pixel value against the existing K components until a match is found (pixel value within $2.5 \sigma_k$ of $\boldsymbol{\mu}_k$).
- If a match is found, adapt the corresponding component.
- Else, replace the least probable component by a distribution with the new value as its mean and an initially high variance and low prior weight.

- Order the components by the value of w_k/σ_k and select the best B components as the background model, where

$$B = \arg \min_b \left(\sum_{k=1}^b \frac{w_k}{\sigma_k} > T \right)$$

Part 3 – Template based Tracking

IC, Stauffer, W.E.L. Grimson, CVPR'99

Recap: Stauffer-Grimson Background Model

• Online adaptation

- Instead of estimating the MoG using EM, use a simpler online adaptation, assigning each new value only to the matching component.
- Let $M_{k,t} = 1$ iff component k is the model that matched, else 0.

$$\pi_k^{(t+1)} = (1 - \alpha) \pi_k^{(t)} + \alpha M_{k,t}$$

- Adapt only the parameters for the matching component

$$\boldsymbol{\mu}_k^{(t+1)} = (1 - \rho) \boldsymbol{\mu}_k^{(t)} + \rho \mathbf{x}^{(t+1)}$$

$$\boldsymbol{\Sigma}_k^{(t+1)} = (1 - \rho) \boldsymbol{\Sigma}_k^{(t)} + \rho (\mathbf{x}^{(t+1)} - \boldsymbol{\mu}_k^{(t+1)}) (\mathbf{x}^{(t+1)} - \boldsymbol{\mu}_k^{(t+1)})^T$$

where

$$\rho = \alpha \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)$$

(i.e., the update is weighted by the component likelihood)

Recap: Kernel Background Modeling

• Nonparametric density estimation

- Estimate a pixel's background distribution using the kernel density estimator $\hat{K}(\cdot)$ as

$$p(\mathbf{x}^{(t)}) = \frac{1}{N} \sum_{i=1}^N K(\mathbf{x}^{(t)} - \mathbf{x}^{(i)})$$

- Choose K to be a Gaussian $\mathcal{N}(0, \boldsymbol{\Sigma})$ with $\boldsymbol{\Sigma} = \text{diag}\{\sigma_j\}$. Then

$$p(\mathbf{x}^{(t)}) = \frac{1}{N} \sum_{i=1}^N \prod_{j=1}^d \frac{1}{\sqrt{2\pi\sigma_j^2}} e^{-\frac{1}{2} \frac{(x_j^{(t)} - x_j^{(i)})^2}{\sigma_j^2}}$$

- A pixel is considered foreground if $p(\mathbf{x}^{(t)}) < \theta$ for a threshold θ .

- This can be computed very fast using lookup tables for the kernel function values, since all inputs are discrete values.
- Additional speedup: partial evaluation of the sum usually sufficient

Practical Issues: Background Model Update

- Kernel background model
 - Sample N intensity values taken over a window of W frames.
- FIFO update mechanism
 - Discard oldest sample.
 - Choose new sample randomly from each interval of length W/N frames.
- When should we update the distribution?
 - **Selective update**: add new sample only if it is classified as a background sample
 - **Blind update**: always add the new sample to the model.

7

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 – Template based Tracking

Updating Strategies

- **Selective update**
 - Add new sample only if it is classified as a background sample.
 - Enhances detection of new objects, since the background model remains uncontaminated.
 - But: Any incorrect detection decision will result in persistent incorrect detections later.
 - ⇒ Deadlock situation.
- **Blind update**
 - Always add the new sample to the model.
 - Does not suffer from deadlock situations, since it does not involve any update decisions.
 - But: Allows intensity values that do not belong to the background to be added to the model.
 - ⇒ Leads to bad detection of the targets (more false negatives).

8

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 – Template based Tracking

Solution: Combining the Two Models

- Short-term model
 - Recent model, adapts to changes quickly to allow very sensitive detection
 - Consists of the most recent N background sample values.
 - Updated using a selective update mechanism based on the detection mask from the final combination result.
- Long-term model
 - Captures a more stable representation of the scene background and adapts to changes slowly.
 - Consists of N samples taken from a much larger time window.
 - Updated using a blind update mechanism.
- Combination
 - Intersection of the two model outputs.

9

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 – Template based Tracking

[A. Elgammal, D. Harwood, L. Davis, ECCV'00]

Applications: Visual Surveillance

- Background modeling to detect objects for tracking
 - Extension: Learning a foreground model for each object.

10

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 – Template based Tracking

Video source: Ian Reid, Univ. of Oxford

Applications: Articulated Tracking

- Background modeling as preprocessing step
 - Track a person's location through the scene
 - Extract silhouette information from the foreground mask.
 - Perform body pose estimation based on this mask.

11

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 – Template based Tracking

Video source: Heddy Kjelstrom, Tobias Jaeger

Summary

- Background Modeling
 - Fast and simple procedure to detect moving object in static camera footage.
 - Makes subsequent tracking *much* easier!
 - ⇒ *If applicable, always make use of this information source!*
- We've looked at two models in detail
 - Adaptive MoG model (Stauffer-Grimson model)
 - Kernel background model (Elgammal et al.)
 - Both perform well in practice, have been used extensively.
- Many extensions available
 - Learning object-specific foreground color models
 - Background modeling for moving cameras

Estimating Optical Flow

Optical Flow

- Given two subsequent frames, estimate the apparent motion field $u(x,y)$ and $v(x,y)$ between them.

Key assumptions

- **Brightness constancy**: projection of the same point looks the same in every frame.
- **Small motion**: points do not move very far.
- **Spatial coherence**: points move like their neighbors.

The Brightness Constancy Constraint

Brightness Constancy Equation:

$$I(x, y, t-1) = I(x+u(x, y), y+v(x, y), t)$$

Linearizing the right hand side using Taylor expansion:

$$I(x, y, t-1) \approx I(x, y, t) + I_x \cdot u(x, y) + I_y \cdot v(x, y)$$

Hence, $I_x \cdot u + I_y \cdot v + I_t \approx 0$

Spatial derivatives Temporal derivative

Computer Vision 2
Part 3 – Template based Tracking

Slide credit: Svetlana Lazebnik

RWTH AACHEN
UNIVERSITY

The Brightness Constancy Constraint

$$I_x \cdot u + I_y \cdot v + I_t = 0$$

How many equations and unknowns per pixel?

- One equation, two unknowns

Intuitively, what does this constraint mean?

$$\nabla I \cdot (u, v) + I_t = 0$$

- It gives us a constraint on the component of the flow in the direction of the gradient.

⇒ The component of the flow perpendicular to the gradient (i.e., parallel to the edge) is unknown!

If (u,v) satisfies the equation,

so does $(u+u', v+v')$ if $\nabla I \cdot (u', v') = 0$

Solving the Aperture Problem

- How to get more equations for a pixel?
- **Spatial coherence constraint**
 - Pretend the pixel's neighbors have the same (u, v) .
 - If we use a 5×5 window, that gives us 25 equations per pixel

$$0 = I_t(p_i) + \nabla I(p_i) \cdot [u \ v]$$

$$\begin{bmatrix} I_x(p_1) & I_y(p_1) \\ I_x(p_2) & I_y(p_2) \\ \vdots & \vdots \\ I_x(p_{25}) & I_y(p_{25}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_t(p_1) \\ I_t(p_2) \\ \vdots \\ I_t(p_{25}) \end{bmatrix}$$

Solving the Aperture Problem

- Least squares problem:

$$\begin{bmatrix} I_x(p_1) & I_y(p_1) \\ I_x(p_2) & I_y(p_2) \\ \vdots & \vdots \\ I_x(p_{25}) & I_y(p_{25}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_t(p_1) \\ I_t(p_2) \\ \vdots \\ I_t(p_{25}) \end{bmatrix} \quad \begin{matrix} A & d = b \\ 25 \times 2 & 2 \times 1 & 25 \times 1 \end{matrix}$$

- Minimum least squares solution given by solution of

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

$$\begin{matrix} A^T A & A^T b \\ 2 \times 2 & 2 \times 1 \end{matrix}$$

(The summations are over all pixels in the $K \times K$ window)

RWTH AACHEN
UNIVERSITY

Conditions for Solvability

- Optimal (u, v) satisfies Lucas-Kanade equation

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

$$A^T A \quad A^T b$$

- When is this solvable?

- $A^T A$ should be invertible.
- $A^T A$ entries should not be too small (noise).
- $A^T A$ should be well-conditioned.
- $\Rightarrow$ Looking for cases where A has two large eigenvalues (i.e., corners and highly textured areas).

UNIVERSITY

Iterative LK Refinement

1. Estimate velocity at each pixel using one iteration of LK estimation.

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

$$A^T A \quad A^T b$$

2. Warp one image toward the other using the estimated flow field.
– (Easier said than done)
3. Refine estimate by repeating the process.

Temporal Aliasing

- Temporal aliasing causes ambiguities in optical flow because images can have many pixels with the same intensity.
- I.e., how do we know which 'correspondence' is correct?

- To overcome aliasing: coarse-to-fine estimation.

Shi-Tomasi Feature Tracker

- Idea
 - Find good features using eigenvalues of second-moment matrix
 - Key idea: “good” features to track are the ones that can be tracked reliably.
- Frame-to-frame tracking
 - Track with LK and a pure *translation* motion model.
 - More robust for small displacements, can be estimated from smaller neighborhoods (e.g., 5×5 pixels).
- Checking consistency of tracks
 - *Affine* registration to the first observed feature instance.
 - Affine model is more accurate for larger displacements.
 - Comparing to the first frame helps to minimize drift.

Real-Time GPU Implementations

- This basic feature tracking framework (Lucas-Kanade + Shi-Tomasi) is commonly referred to as “KLT tracking”.
 - Often used as first step in SIM/SLAM pipelines
 - Lends itself to easy parallelization
- Very fast GPU implementations available, e.g.,
 - C. Zach, D. Gallup, J.-M. Frahm, [Fast Gain-Adaptive KLT tracking on the GPU](http://www.cs.unc.edu/~ssinha/Research/GPU_KLT/). In CVGPU'08 Workshop, Anchorage, USA, 2008
 - 216 fps with automatic gain adaptation
 - 260 fps without gain adaptation

Lucas-Kanade Template Tracking

- Traditional LK
 - Typically run on small, corner-like features (e.g., 5×5 patches) to compute optical flow ($\rightarrow$ KLT).
 - However, there is no reason why we can't use the same approach on a larger window around the tracked object.

Basic LK Derivation for Templates

$$E(u, v) = \sum_{\mathbf{x}} [I(x+u, y+v) - T(x, y)]^2$$

Template model

Current frame

 (u, v) = hypothesized location of template in current frame

43

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 - Template based Tracking
Slide credit: Robert CollinsRWTH AACHEN
UNIVERSITY

Basic LK Derivation for Templates

- Taylor expansion

$$\begin{aligned} E(u, v) &= \sum_{\mathbf{x}} [I(x+u, y+v) - T(x, y)]^2 \\ &\approx \sum_{\mathbf{x}} [I(x, y) + uI_x(x, y) + vI_y(x, y) - T(x, y)]^2 \\ &= \sum_{\mathbf{x}} [uI_x(x, y) + vI_y(x, y) + D(x, y)]^2 \quad \text{with } D = I - T \end{aligned}$$

- Taking partial derivatives

$$\frac{\partial E}{\partial u} = 2 \sum_{\mathbf{x}} [uI_x(x, y) + vI_y(x, y) + D(x, y)] I_x(x, y) \stackrel{!}{=} 0$$

$$\frac{\partial E}{\partial v} = 2 \sum_{\mathbf{x}} [uI_x(x, y) + vI_y(x, y) + D(x, y)] I_y(x, y) \stackrel{!}{=} 0$$

- Equation in matrix form

$$\sum_{\mathbf{x}} \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = \sum_{\mathbf{x}} \begin{bmatrix} I_x D \\ I_y D \end{bmatrix} \Rightarrow \text{Solve via least-squares}$$

Part 3 - Template based Tracking
Slide credit: Robert CollinsRWTH AACHEN
UNIVERSITY

One Problem With This...

- Problematic Assumption

– Assumption of constant flow (pure translation) for all pixels in a larger window is unreasonable for long periods of time.

- However...

– We can easily generalize the LK approach to other 2D parametric motion models (like affine or projective) by introducing a "warp" function $\mathbf{W}$ with parameters $\mathbf{p}$.

$$E(u, v) = \sum_{\mathbf{x}} [I(x+u, y+v) - T(x, y)]^2$$

$$\downarrow$$

$$E(\mathbf{p}) = \sum_{\mathbf{x}} [I(\mathbf{W}([x, y]; \mathbf{p})) - T([x, y])]^2$$

Example Warping Functions

- Translation

$$\mathbf{W}([x, y]; \mathbf{p}) = \begin{bmatrix} x + p_1 \\ y + p_2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & p_1 \\ 0 & 1 & p_2 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- Affine

$$\mathbf{W}([x, y]; \mathbf{p}) = \begin{bmatrix} x + p_1x + p_3y + p_5 \\ y + p_2x + p_4y + p_6 \end{bmatrix} = \begin{bmatrix} 1 + p_1 & p_3 & p_5 \\ p_2 & 1 + p_4 & p_6 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- Perspective

$$\mathbf{W}([x, y]; \mathbf{p}) = \frac{1}{p_7x + p_8y + 1} \begin{bmatrix} x + p_1x + p_3y + p_5 \\ y + p_2x + p_4y + p_6 \end{bmatrix}$$

– Note: Other parametrizations are possible; the above ones are just particularly convenient here.

48

UNIVERSITY

General LK Image Registration

- Goal
 - Find the warping parameters $\mathbf{p}$ that minimize the sum-of-squares intensity difference between the template image and the warped input image.
- LK formulation
 - Formulate this as an optimization problem

$$\arg \min_{\mathbf{p}} \sum_{\mathbf{x}} [I(\mathbf{W}(\mathbf{x}; \mathbf{p})) - T(\mathbf{x})]^2$$
 - We assume that an initial estimate of $\mathbf{p}$ is known and iteratively solve for increments to the parameters $\Delta \mathbf{p}$:

$$\arg \min_{\Delta \mathbf{p}} \sum_{\mathbf{x}} [I(\mathbf{W}(\mathbf{x}; \mathbf{p} + \Delta \mathbf{p})) - T(\mathbf{x})]^2$$

49

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 – Template based Tracking

RWTH AACHEN
UNIVERSITY

Step-by-Step Derivation

- Key to the derivation
 - Taylor expansion around $\Delta \mathbf{p}$

$$I(\mathbf{W}(\mathbf{x}; \mathbf{p} + \Delta \mathbf{p})) \approx I(\mathbf{W}(\mathbf{x}; \mathbf{p})) + \nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \Delta \mathbf{p} + \mathcal{O}(\Delta \mathbf{p}^2)$$
 - Using pixel coordinates $\mathbf{x} = [x, y]$

$$I(\mathbf{W}([x, y]; \mathbf{p} + \Delta \mathbf{p})) \approx I(\mathbf{W}([x, y]; p_1, \dots, p_n))$$

$$+ \left[\frac{\partial I}{\partial x} \frac{\partial W_x}{\partial p_1} + \frac{\partial I}{\partial y} \frac{\partial W_y}{\partial p_1} \right]_{p_1} \Delta p_1$$

$$+ \left[\frac{\partial I}{\partial x} \frac{\partial W_x}{\partial p_2} + \frac{\partial I}{\partial y} \frac{\partial W_y}{\partial p_2} \right]_{p_1} \Delta p_2$$

$$+ \dots$$

$$+ \left[\frac{\partial I}{\partial x} \frac{\partial W_x}{\partial p_n} + \frac{\partial I}{\partial y} \frac{\partial W_y}{\partial p_n} \right]_{p_n} \Delta p_n$$

Step-by-Step Derivation

- Rewriting this in matrix notation

$$I(\mathbf{W}([x, y]; \mathbf{p} + \Delta \mathbf{p})) \approx I(\mathbf{W}([x, y]; p_1, \dots, p_n))$$

$$+ \left[\frac{\partial I}{\partial x} \quad \frac{\partial I}{\partial y} \right] \begin{bmatrix} \frac{\partial W_x}{\partial p_1} \\ \frac{\partial W_y}{\partial p_1} \end{bmatrix}_{p_1} \Delta p_1$$

$$+ \left[\frac{\partial I}{\partial x} \quad \frac{\partial I}{\partial y} \right] \begin{bmatrix} \frac{\partial W_x}{\partial p_2} \\ \frac{\partial W_y}{\partial p_2} \end{bmatrix}_{p_2} \Delta p_2$$

$$+ \dots$$

$$+ \left[\frac{\partial I}{\partial x} \quad \frac{\partial I}{\partial y} \right] \begin{bmatrix} \frac{\partial W_x}{\partial p_n} \\ \frac{\partial W_y}{\partial p_n} \end{bmatrix}_{p_n} \Delta p_n$$

Example: Jacobian of Affine Warp

- General equation of Jacobian

$$\frac{\partial \mathbf{W}}{\partial \mathbf{p}} = \begin{bmatrix} \frac{\partial W_x}{\partial p_1} & \frac{\partial W_x}{\partial p_2} & \dots & \frac{\partial W_x}{\partial p_n} \\ \frac{\partial W_y}{\partial p_1} & \frac{\partial W_y}{\partial p_2} & \dots & \frac{\partial W_y}{\partial p_n} \end{bmatrix}$$
- Affine warp function (6 parameters)

$$\mathbf{W}([x, y]; \mathbf{p}) = \begin{bmatrix} 1 + p_1 & p_3 & p_5 \\ p_2 & 1 + p_4 & p_6 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$
- Result

$$\frac{\partial \mathbf{W}}{\partial \mathbf{p}} = \frac{\partial}{\partial \mathbf{p}} \begin{bmatrix} x + p_1 x + p_3 y + p_5 \\ p_2 x + y + p_4 y + p_6 \end{bmatrix}$$

$$= \begin{bmatrix} x & 0 & y & 0 & 1 & 0 \\ 0 & x & 0 & y & 0 & 1 \end{bmatrix}$$

UNIVERSITY

Minimizing the Registration Error

- Optimization function after Taylor expansion

$$\arg \min_{\Delta \mathbf{p}} \sum_{\mathbf{x}} \left[I(\mathbf{W}(\mathbf{x}; \mathbf{p})) + \nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \Delta \mathbf{p} - T(\mathbf{x}) \right]^2$$

- Minimizing this function

- Taking the partial derivative and setting it to zero

$$\frac{\partial}{\partial \Delta \mathbf{p}} \stackrel{!}{=} 0 \rightarrow 2 \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^T \left[I(\mathbf{W}(\mathbf{x}; \mathbf{p})) + \nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \Delta \mathbf{p} - T(\mathbf{x}) \right] \stackrel{!}{=} 0$$

- Closed-form solution for $\Delta \mathbf{p}$ (Gauss-Newton):

$$\Delta \mathbf{p} = \mathbf{H}^{-1} \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^T [T(\mathbf{x}) - I(\mathbf{W}(\mathbf{x}; \mathbf{p}))]$$

- where $\mathbf{H}$ is the Hessian

$$\mathbf{H} = \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^T \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]$$

Summary: Inverse Compositional LK Algorithm

- Iterate

- Warp I to obtain $I(\mathbf{W}([x, y]; \mathbf{p}))$
- Compute the error image $T([x, y]) - I(\mathbf{W}([x, y]; \mathbf{p}))$
- Warp the gradient ∇I with $\mathbf{W}([x, y]; \mathbf{p})$
- Evaluate $\frac{\partial \mathbf{W}}{\partial \mathbf{p}}$ at $([x, y]; \mathbf{p})$ (Jacobian)
- Compute steepest descent images $\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}}$
- Compute Hessian matrix $\mathbf{H} = \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^T \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]$
- Compute $\sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^T [T([x, y]) - I(\mathbf{W}([x, y]; \mathbf{p}))]$
- Compute $\Delta \mathbf{p} = \mathbf{H}^{-1} \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^T [T([x, y]) - I(\mathbf{W}([x, y]; \mathbf{p}))]$
- Update the parameters $\mathbf{p} \leftarrow \mathbf{p} + \Delta \mathbf{p}$

- Until $\Delta \mathbf{p}$ magnitude is negligible

Discussion LK Alignment

- Pros

- All pixels get used in matching
- Can get sub-pixel accuracy (important for good mosaicking)
- Fast and simple algorithm
- Applicable to Optical Flow estimation, stereo disparity estimation, parametric motion tracking, etc.

- Cons

- Prone to local minima.
- Relatively small movement.
- ⇒ Good initialization necessary

58

Visual Computing Institute | Prof. Dr. Bastian Leibe

Part 3 – Template based Tracking

RWTH AACHEN
UNIVERSITY

Side Note

- LK Registration needs a good initialization

- Taylor expansion corresponds to a linearization around the initial position $\mathbf{p}$.
- This linearization is only valid in a small neighborhood around $\mathbf{p}$.

- When tracking templates...

- We typically use the previous frame's result as initialization.
- ⇒ The higher the frame rate, the smaller the warp will be.
- ⇒ This means we get better results and need fewer LK iterations.
- ⇒ Tracking becomes easier (and faster!) with higher frame rates.

Discussion

- Beyond 2D Tracking/Registration

- So far, we focused on registration between 2D images.
- The same ideas can be used when performing registration between a 3D model and the 2D image (model-based tracking).
- The approach can also be extended for dealing with articulated objects and for tracking in subspaces.

⇒ We will come back to this in later lectures when we talk about model-based 3D tracking...

Topics of This Lecture

- Lucas-Kanade Optical Flow
 - Brightness Constancy constraint
 - LK flow estimation
 - Coarse-to-fine estimation
- Feature Tracking
 - KLT feature tracking
- Template Tracking
 - LK derivation for templates
 - Warping functions
 - General LK image registration
- Applications

61

Visual Computing Institute | Prof. Dr. Bastian Leibe
Computer Vision 2
Part 3 – Template based Tracking

RWTH AACHEN
UNIVERSITY

Example of a More Complex Warping Function

- Encode geometric constraints into region tracking
 - Constrained homography transformation model
 - Translation parallel to the ground plane
 - Rotation around the ground plane normal
 - $\mathbf{W}(\mathbf{x}) = \mathbf{W}_{obj} \mathbf{P} \mathbf{W}_t \mathbf{W}_a \mathbf{Q} \mathbf{x}$
- ⇒ Input for high-level tracker with car steering model.
