

## **Computer Vision - Lecture 22**

Repetition

09.02.2016

Bastian Leibe RWTH Aachen http://www.vision.rwth-aachen.de

leibe@vision.rwth-aachen.de

#### **Announcements**

#### Exam

- 1st Date: Monday, 29.02., 13:30 17:30h
- 2<sup>nd</sup> Date: Thursday, 31.03., 09:30 12:30h
- Closed-book exam, the core exam time will be 2h.
- We will send around an announcement with the exact starting times and places by email.

#### Test exam

- Date: Thursday, 11.02., 14:15 15:45h, room UMIC 025
- Core exam time will be 1h
- Purpose: Prepare you for the questions you can expect.
- Possibility to collect bonus exercise points!

### Announcements (2)

Feedback to the lecture evaluation

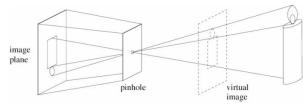

### Announcements (3)

- Today, I'll summarize the most important points from the lecture.
  - It is an opportunity for you to ask questions...
  - ...or get additional explanations about certain topics.
  - So, please do ask.
- Today's slides are intended as an index for the lecture.
  - But they are not complete, won't be sufficient as only tool.
  - Also look at the exercises they often explain algorithms in detail.

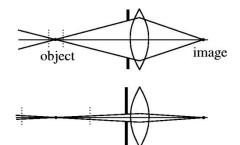

#### Repetition

- Image Processing Basics
  - Image Formation
  - Binary Image Processing
  - Linear Filters
  - Edge & Structure Extraction
- Segmentation & Grouping
- Object Recognition
- Local Features & Matching
- Object Categorization
- 3D Reconstruction
- Motion and Tracking

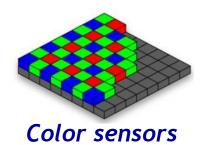

Pinhole camera model

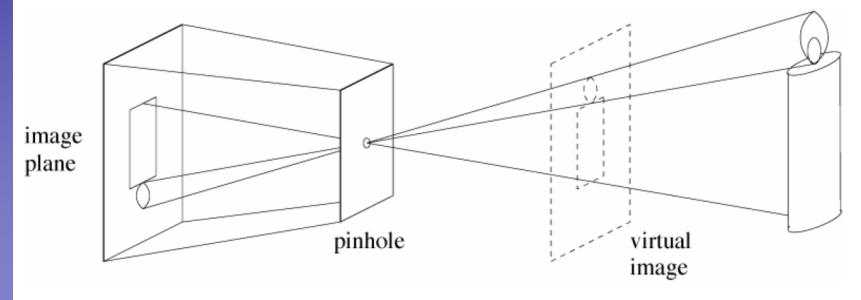

Lenses, focal length, aperture

### Recap: Pinhole Camera

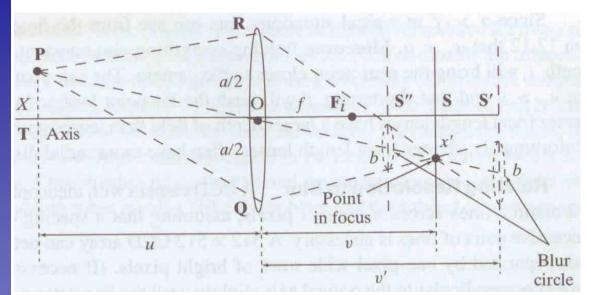

- (Simple) standard and abstract model today
  - Box with a small hole in it
  - Works in practice

6

### Recap: Focus and Depth of Field

"circles of confusion"

Thin lens: scene points at distinct depths come in focus at different image planes.

(Real camera lens systems have greater depth of field.)

 Depth of field: distance between image planes where blur is tolerable

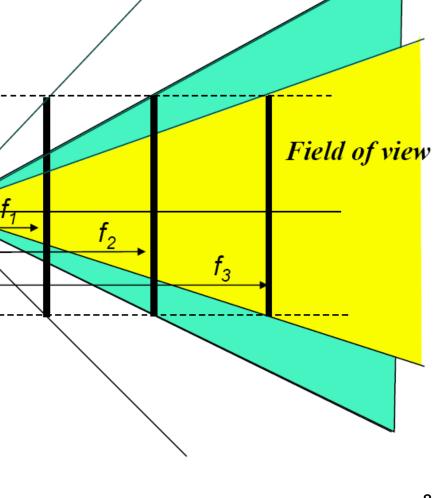

### Recap: Field of View and Focal Length

- As f gets smaller, image becomes more wide angle
  - More world points project onto the finite image plane

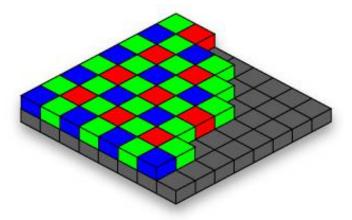

• As f gets larger, image becomes more telescopic

Smaller part of the world projects onto the finite image plane

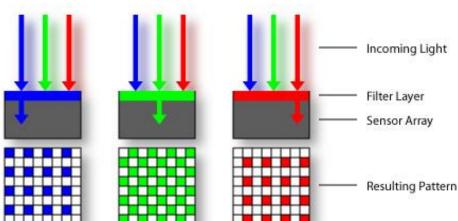

#### Recap: Color Sensing in Digital Cameras

#### Bayer grid

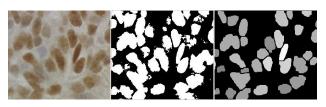

Estimate missing components from neighboring values (demosaicing)

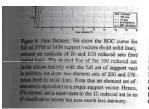

#### Repetition

- Image Processing Basics
  - Image Formation
  - Binary Image Processing
  - Linear Filters
  - Edge & Structure Extraction
- Segmentation & Grouping
- Object Recognition
- Local Features & Matching
- Object Categorization
- 3D Reconstruction
- Motion and Tracking

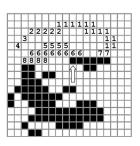

piget 4: The Dartiest: we show the RCC, curve for the fall as SYM of 143 supper; vector field soid fine), two advant set methods of 10 and 100 reduced sets (both in duabel line). The cleaked line of the 100 reduced set colacted sincert entirely with the full set of support vectors. In addition, we show two elements sets of 2000 and 576 clamans (both in soid line). Note that an element set of 576 dements is quivalent to a unified approt vector. Hence FT6 sement set is equivalent to the 10 reduced set in terms of destification power but steem much less enemony.

#### **Thresholding**

 $A \circ B = (A \ominus B) \oplus B$ 

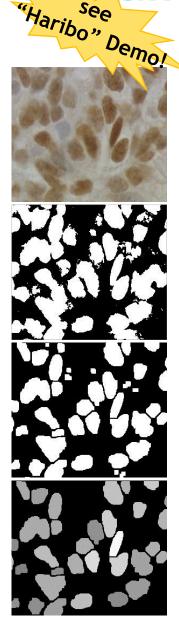

#### Morphological Operators

**Connected Components** 

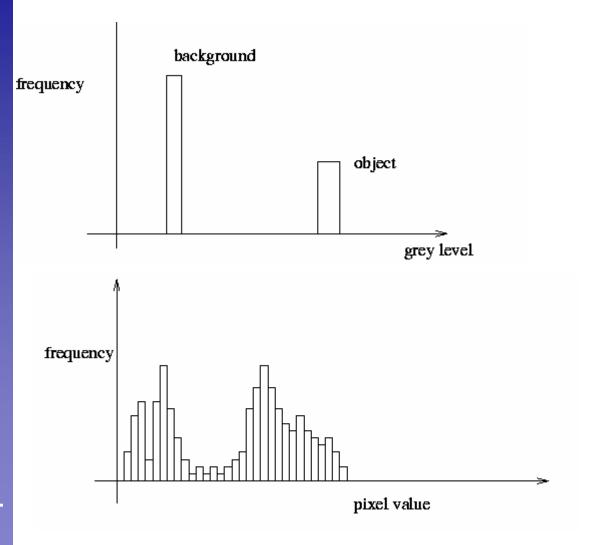

### Recap: Binary Processing Pipeline

- Convert the image into binary form
  - > Thresholding
- Clean up the thresholded image
  - Morphological operators
- Extract individual objects
  - Connected Components Labeling
- Describe the objects
  - Region properties

### Recap: Robust Thresholding

Ideal histogram, light object on dark background

Actual observed histogram with noise

Assumption here: only two modes

Source: Robyn Owens

B. Leibe

# Recap: Global Binarization [Otsu'79] Exercise 2.11

- Precompute a cumulative grayvalue histogram h.
- For each potential threshold T
  - 1.) Separate the pixels into two clusters according to T.
  - 2.) Compute both cluster means  $\mu_1(T)$  and  $\mu_2(T)$ . Look up  $n_1$ ,  $n_2$  in h

$$n_1(T) = |\{I_{(x,y)} < T\}|, \quad n_2(T) = |\{I_{(x,y)} \ge T\}|$$

3.) Compute the between-class variance  $\sigma_{hotwoon}^2(T)$ 

$$\sigma_{between}^2(T) = n_1(T)n_2(T) [\mu_1(T) - \mu_2(T)]^2$$

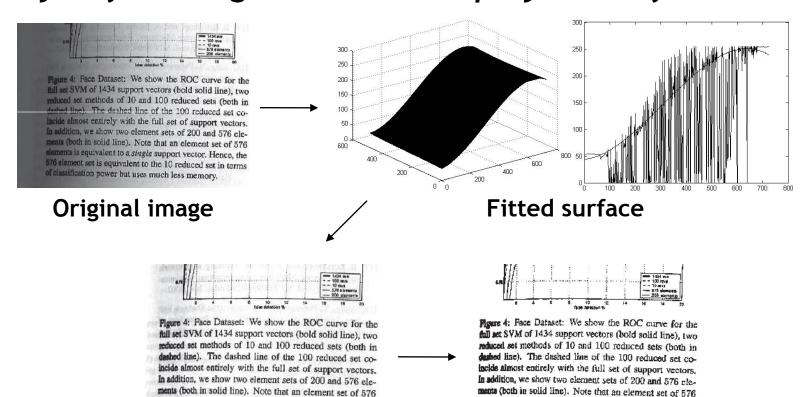

Choose the threshold that maximizes

$$T^* = \arg\max_{T} \left[ \sigma_{between}^2(T) \right]$$

### Recap: Background Surface Fitting

- Document images often contain a smooth gradient
- ⇒Try to fit that gradient with a polynomial function

**Shading compensation** 

elements is equivalent to a single support vector. Hence, the

576 element set is equivalent to the 10 reduced set in terms

of classification power but uses much less memory.

Binarized result

elements is equivalent to a single support vector. Hence, the

576 element set is equivalent to the 10 reduced set in terms

of classification power but uses much less memory.

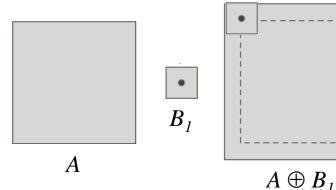

### **Recap: Dilation**

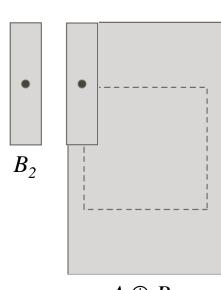

#### Definition

- "The dilation of A by B is the set of all displacements z, such that  $(\hat{B})_z$  and A overlap by at least one element".
- $((\hat{B})_z)$  is the mirrored version of B, shifted by z)

#### Effects

- If current pixel z is foreground, set all pixels under  $(B)_z$  to foreground.
- $\Rightarrow$  Expand connected components
- ⇒ Grow features
- ⇒ Fill holes

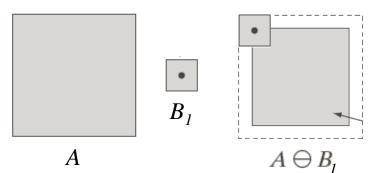

### **Recap: Erosion**

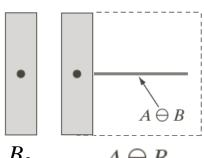

#### Definition

"The erosion of A by B is the set of all displacements z, such that  $(B)_z$  is entirely contained in A".

#### Effects

- If not every pixel under  $(B)_z$  is foreground, set the current pixel z to background.
- ⇒ Erode connected components
- ⇒ Shrink features
- ⇒ Remove bridges, branches, noise

 $B_2 \qquad A \ominus B_2$ 

### Recap: Opening

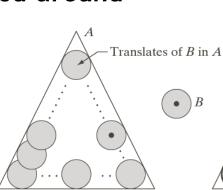

- Definition
  - Sequence of Erosion and Dilation

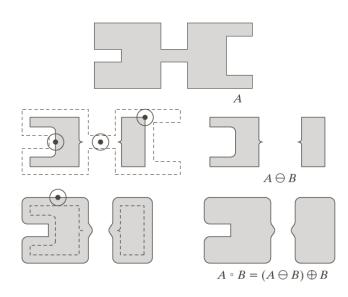

$$A \circ B = (A \ominus B) \oplus B$$

 $A \circ B$  is defined by the points that are reached if B is rolled around inside A.

⇒ Remove small objects, keep original shape.

 $A \oplus B$ 

 $A \cdot B = (A \oplus B) \ominus B$ 

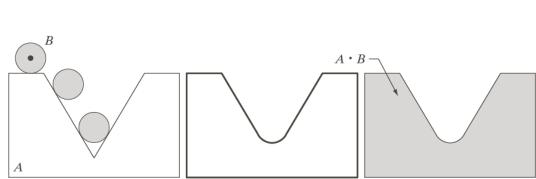

### Recap: Closing

- Definition
  - Sequence of Dilation and Erosion

$$A \cdot B = (A \oplus B) \ominus B$$

- $A \cdot B$  is defined by the points that are reached if B is rolled around on the outside of A.
- ⇒ Fill holes, keep original shape.

### Recap: Connected Components Labeling

- Process the image from left to right, top to bottom:
  - 1.) If the next pixel to process is 1

i.) If only one of its neighbors (top or left) is 1, copy its label.

ii.) If both are 1 and have the same label, copy it.

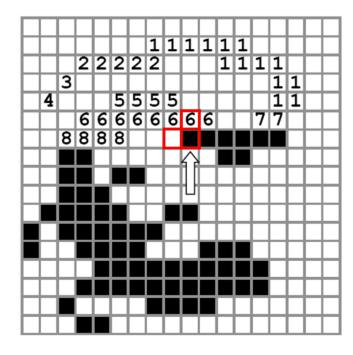

iii.) If they have different labels

- Copy the label from the left.
- Update the equivalence table.

iv.) Otherwise, assign a new label.

Re-label with the smallest of equivalent labels

$$\begin{cases}
\frac{1}{3} & 2, 7 \\
\frac{3}{4} & \\
5, 6, 8
\end{cases}$$

### Recap: Region Properties

- From the previous steps, we can obtain separated objects.
- Some useful features can be extracted once we have connected components, including
  - Area
  - Centroid
  - Extremal points, bounding box
  - Circularity
  - Spatial moments

### **Recap: Moment Invariants**

Normalized central moments

$$\eta_{pq} = \frac{\mu_{pq}}{\mu_{00}^{\gamma}}, \qquad \gamma = \frac{p+q}{2} + 1$$

• From those, a set of *invariant moments* can be defined for object description.

$$\phi_1 = \eta_{20} + \eta_{02}$$

$$\phi_2 = (\eta_{20} - \eta_{02})^2 + 4\eta_{11}^2$$

$$\phi_3 = (\eta_{30} - 3\eta_{12})^2 + (3\eta_{21} - \eta_{03})^2$$

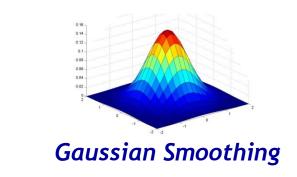

$$\phi_4 = (\eta_{30} + \eta_{12})^2 + (\eta_{21} + \eta_{03})^2$$

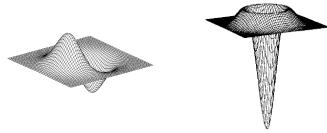

(Additional invariant moments  $\phi_5$ ,  $\phi_6$ ,  $\phi_7$  can be found in the literature).

 Robust to translation, rotation & scaling, but don't expect wonders (still summary statistics).

#### Repetition

- Image Processing Basics
  - Image Formation
  - Binary Image Processing
  - Linear Filters
  - Edge & Structure Extraction
- Segmentation & Grouping
- Object Recognition
- Local Features & Matching
- Object Categorization
- 3D Reconstruction
- Motion and Tracking

**Derivative operators** 

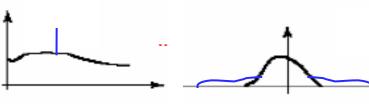

Gaussian/Laplacian pyramid

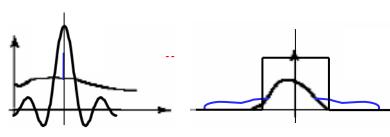

### Recap: Effect of Filtering

 Noise introduces high frequencies.
 To remove them, we want to apply a "low-pass" filter.

 The ideal filter shape in the frequency domain would be a box.
 But this transfers to a spatial sinc, which has infinite spatial support.

 A compact spatial box filter transfers to a frequency sinc, which creates artifacts.

 A Gaussian has compact support in both domains. This makes it a convenient choice for a low-pass filter.

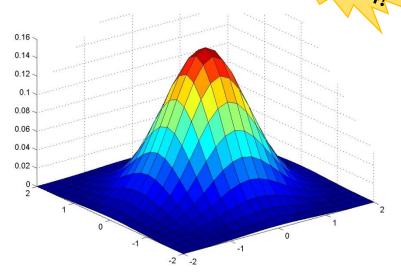

### Recap: Gaussian Smoothing

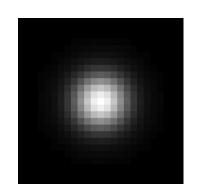

Exercise 2.4!

Gaussian kernel

$$G_{\sigma} = \frac{1}{2\pi\sigma^2} e^{-\frac{(x^2+y^2)}{2\sigma^2}}$$

- Rotationally symmetric
- Weights nearby pixels more than distant ones
  - This makes sense as 'probabilistic' inference about the signal
- A Gaussian gives a good model of a fuzzy blob

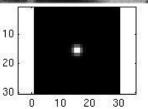

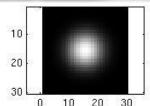

### Recap: Smoothing with a Gaussian

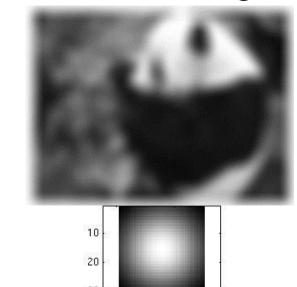

• Parameter  $\sigma$  is the "scale" / "width" / "spread" of the Gaussian kernel and controls the amount of smoothing.

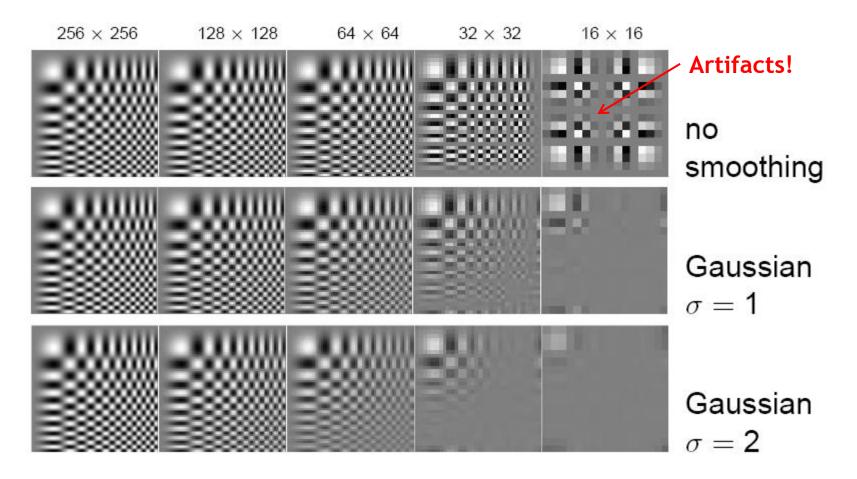

```
for sigma=1:3:10
  h = fspecial('gaussian', fsize, sigma);
  out = imfilter(im, h);
  imshow(out);
  pause;
end
```

Slide credit: Kristen Grauman

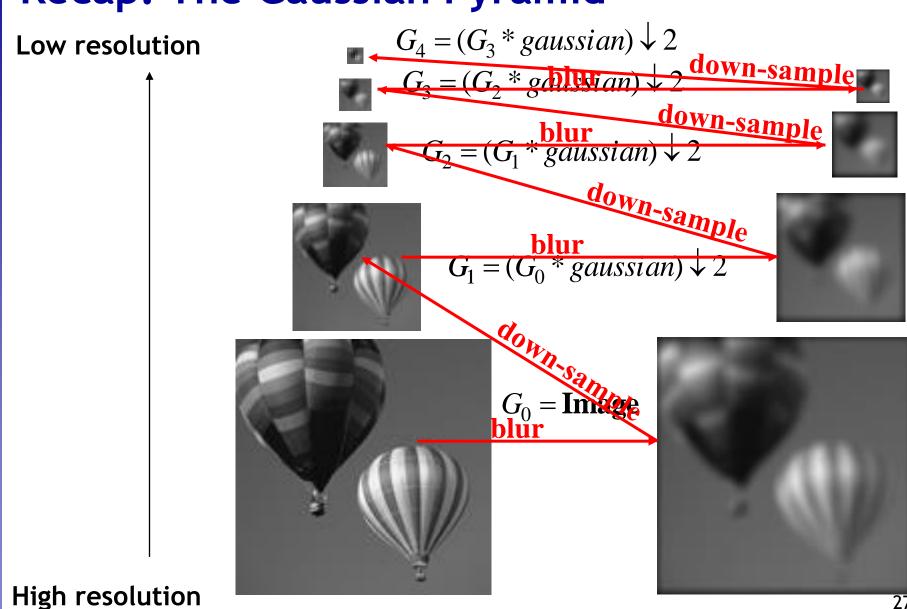

B. Leibe

### Recap: Resampling with Prior Smoothing

 Note: We cannot recover the high frequencies, but we can avoid artifacts by smoothing before resampling.

### Recap: The Gaussian Pyramid

B. Leibe

Source: Irani & Basri

### Recap: Median Filter

#### Basic idea

Replace each pixel by the median of its neighbors.

10 15 20 23 90 27 33 31 30 Sort 10 15 20 23 27 30 31 33

#### Properties

- Doesn't introduce new pixel values
- Removes spikes: good for impulse, salt & pepper noise
- Nonlinear
- Edge preserving

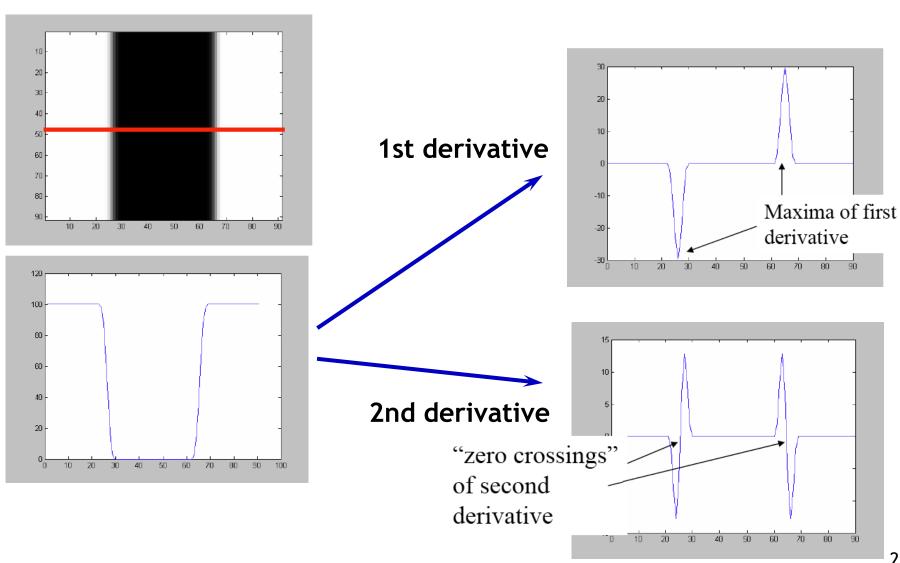

10	15	20	
23	27	27	
33	31	30	

Replace

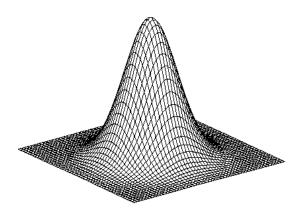

### Recap: Derivatives and Edges...

### Recap: 2D Edge Detection Filters

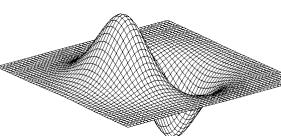

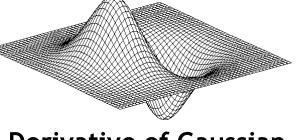

#### Laplacian of Gaussian

#### Gaussian

$$h_{\sigma}(u,v) = \frac{1}{2\pi\sigma^2} e^{-\frac{u^2+v^2}{2\sigma^2}} \qquad \frac{\partial}{\partial x} h_{\sigma}(u,v) \qquad \nabla^2 h_{\sigma}(u,v)$$

#### **Derivative of Gaussian**

$$\frac{\partial}{\partial x}h_{\sigma}(u,v)$$

$$\nabla^2 h_{\sigma}(u,v)$$

$$\nabla^2 f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$$

#### Repetition

- **Image Processing Basics** 
  - **Image Formation**
  - **Binary Image Processing**
  - Linear Filters
  - **Edge & Structure Extraction**
- Segmentation & Grouping
- **Object Recognition**
- Local Features & Matching
- **Object Categorization**
- 3D Reconstruction
- Motion and Tracking

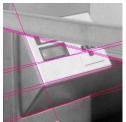

Canny edge detector

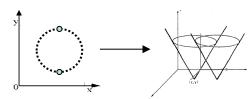

Chamfer matching

Hough transform for lines

Hough transform for circles 31

### Recap: Canny Edge Detector

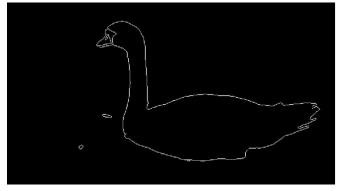

- Exercise 2.6!
- 1. Filter image with derivative of Gaussian
- 2. Find magnitude and orientation of gradient
- 3. Non-maximum suppression:
  - Thin multi-pixel wide "ridges" down to single pixel width
- 4. Linking and thresholding (hysteresis):
  - Define two thresholds: low and high
  - Use the high threshold to start edge curves and the low threshold to continue them
- MATLAB:
  - >> edge(image, 'canny');
  - >> help edge

adapted from D. Lowe, L. Fei-Fei

#### Recap: Edges vs. Boundaries

Edges useful signal to indicate occluding boundaries, shape.

Here the raw edge output is not so bad...

Slide credit: Kristen Grauman

...but quite often boundaries of interest are fragmented, and we have extra "clutter" edge points.

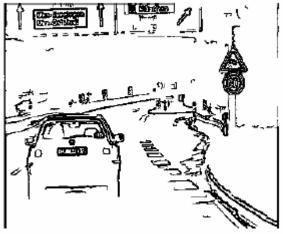

### **Recap: Chamfer Matching**

- Chamfer Distance
  - Average distance to nearest feature

$$D_{chamfer}(T, I) \equiv \frac{1}{|T|} \sum_{t \in T} d_I(t)$$

This can be computed efficiently by correlating the edge template with the distance-transformed image

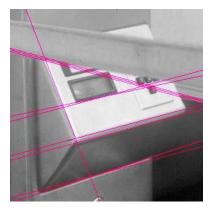

Edge image

Distance transform image

[D. Gavrila, DAGM'99]

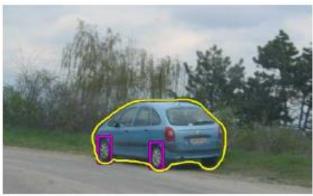

#### Recap: Fitting and Hough Transform

Given a model of interest, we can overcome some of the missing and noisy edges using fitting techniques.

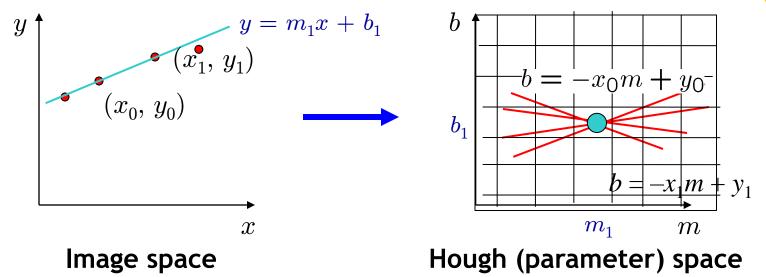

With voting methods like the Hough transform, detected points vote on possible model parameters.

### **Recap: Hough Transform**

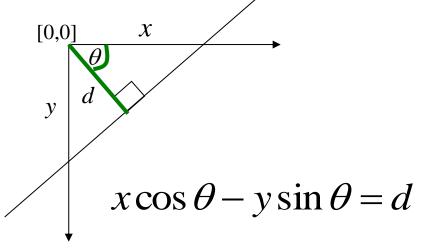

Exercise 3.1!

- How can we use this to find the most likely parameters (m,b) for the most prominent line in the image space?
  - Let each edge point in image space vote for a set of possible parameters in Hough space
  - Accumulate votes in discrete set of bins; parameters with the most votes indicate line in image space.

## Recap: Hough Transf. Polar Parametrization

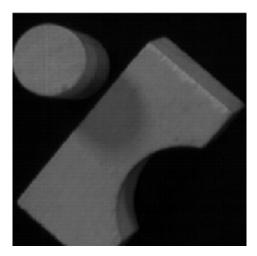

• Usual (m,b) parameter space problematic: can take on infinite values, undefined for vertical lines.

Point in image space
 ⇒ sinusoid segment in
 Hough space

d: perpendicular distance from line to origin

 $\theta$ : angle the perpendicular makes with the x-axis

Slide credit: Steve Seitz

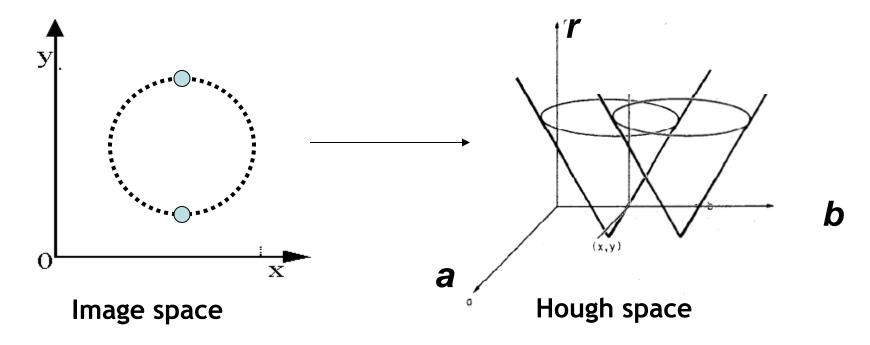

## **Recap: Hough Transform for Circles**

• Circle: center (a,b) and radius r

$$(x_i - a)^2 + (y_i - b)^2 = r^2$$

• For an unknown radius r, unknown gradient direction

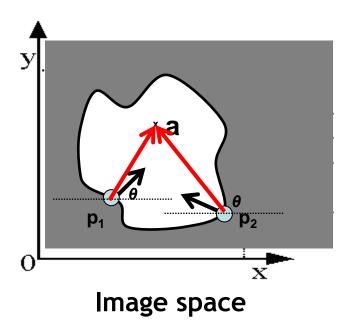

38

## Recap: Generalized Hough Transform

 What if want to detect arbitrary shapes defined by boundary points and a reference point?

At each boundary point, compute displacement

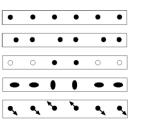

vector:  $r = a - p_i$ .

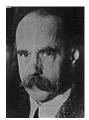

For a given model shape: store these vectors in a table indexed by gradient orientation  $\theta$ .

[Dana H. Ballard, Generalizing the Hough Transform to Detect Arbitrary Shapes, 1980]

## Repetition

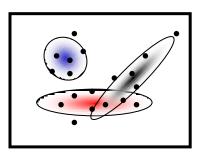

- Image Processing Basics
- Segmentation & Grouping
  - Segmentation and Grouping
  - Segmentation as Energy Minimization
- Object Recognition
- Local Features & Matching
- Object Categorization
- 3D Reconstruction
- Motion and Tracking

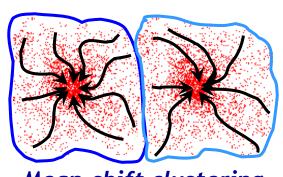

K-Means & EM clustering

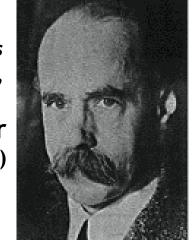

## **Recap: Gestalt Theory**

- Gestalt: whole or group
  - Whole is greater than sum of its parts
  - Relationships among parts can yield new properties/features
- Psychologists identified series of factors that predispose set of elements to be grouped (by human visual system)

"I stand at the window and see a house, trees, sky. Theoretically I might say there were 327 brightnesses and nuances of colour. Do I have "327"? No. I have sky, house, and trees."

Max Wertheimer (1880-1943)

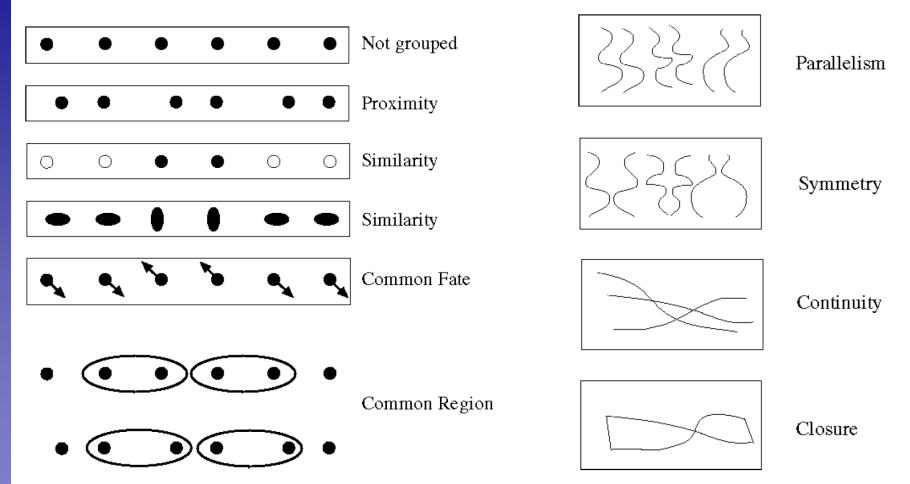

Untersuchungen zur Lehre von der Gestalt,

Psychologische Forschung, Vol. 4, pp. 301-350, 1923

http://psy.ed.asu.edu/~classics/Wertheimer/Forms/forms.htm

## **Recap: Gestalt Factors**

 These factors make intuitive sense, but are very difficult to translate into algorithms.

## **Recap: Image Segmentation**

Goal: identify groups of pixels that go together

## Recap: K-Means Clustering

- Basic idea: randomly initialize the k cluster centers, and iterate between the two following steps
  - 1. Randomly initialize the cluster centers,  $c_1, ..., c_K$
  - 2. Given cluster centers, determine points in each cluster
    - For each point p, find the closest c<sub>i</sub>. Put p into cluster i
  - 3. Given points in each cluster, solve for c<sub>i</sub>
    - Set c<sub>i</sub> to be the mean of points in cluster i
  - 4. If c<sub>i</sub> have changed, repeat Step 2

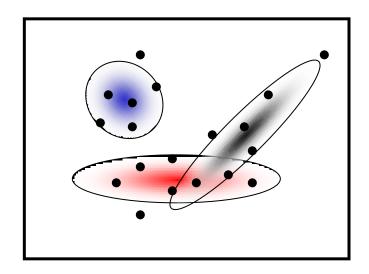

#### Properties

- Will always converge to some solution
- Can be a "local minimum"
  - Does not always find the global minimum of objective function:

$$\sum_{\text{clusters } i} \sum_{\text{points p in cluster } i} ||p - c_i||^2$$

## Recap: Expectation Maximization (EM)

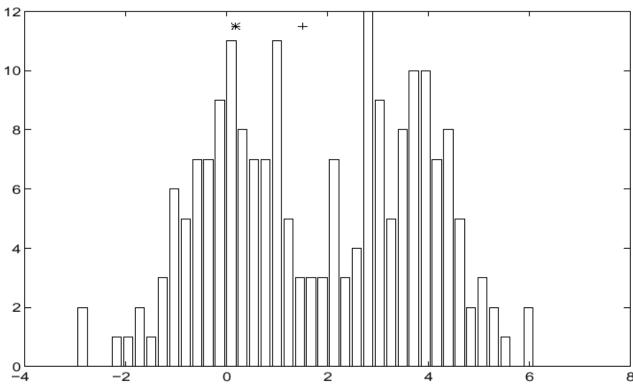

- Goal
  - $\triangleright$  Find blob parameters  $\theta$  that maximize the likelihood function:

$$p(data|\theta) = \prod_{n=1}^{N} p(\mathbf{x}_n|\theta)$$

- Approach:
  - 1. E-step: given current guess of blobs, compute ownership of each point
  - M-step: given ownership probabilities, update blobs to maximize likelihood function
  - 3. Repeat until convergence

## Recap: Mean-Shift Algorithm

#### **Iterative Mode Search**

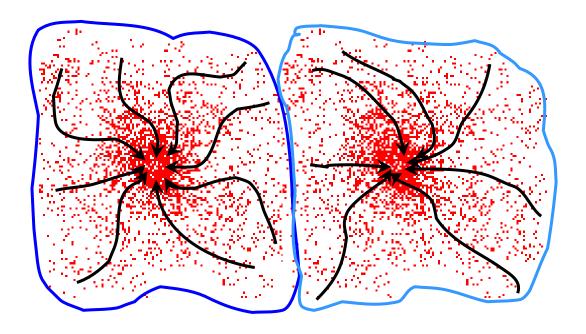

- Initialize random seed, and window W
- Calculate center of gravity (the "mean") of W:  $\sum xH(x)$  $x \in W$
- Shift the search window to the mean
- Repeat Step 2 until convergence

46

## Recap: Mean-Shift Clustering

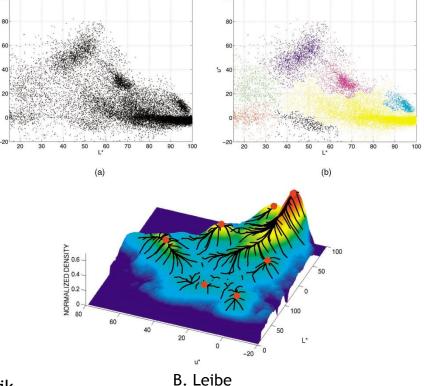

- Cluster: all data points in the attraction basin of a mode
- Attraction basin: the region for which all trajectories lead to the same mode

## Recap: Mean-Shift Segmentation

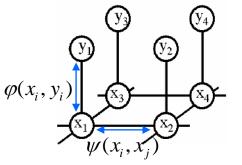

- Exercise 3.3!
- Find features (color, gradients, texture, etc)
- Initialize windows at individual pixel locations
- Perform mean shift for each window until convergence
- Merge windows that end up near the same "peak" or

mode

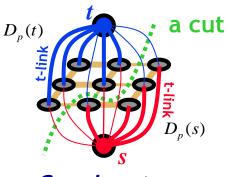

### Repetition

- Image Processing Basics
- Segmentation & Grouping
  - Segmentation and Grouping
  - Segmentation as Energy Minimization
- Object Recognition
- Local Features & Matching
- Object Categorization
- 3D Reconstruction
- Motion and Tracking

#### **Markov Random Fields**

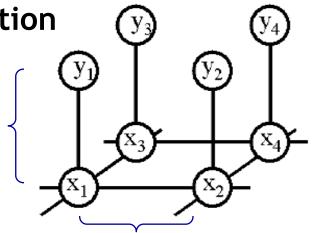

**Graph cuts** 

## Recap: MRFs for Image Segmentation

MRF formulation

Unary potentials  $\phi(x_i,y_i)$ 

Pairwise potentials

$$\psi(x_i,x_j)$$

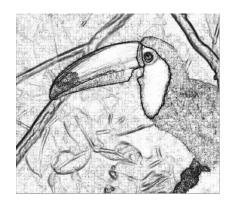

$$E(\mathbf{x}, \mathbf{y}) = \sum_{i} \phi(x_i, y_i) + \sum_{i,j} \psi(x_i, x_j)$$

Data (D)

Unary likelihood

Pair-wise Terms

**MAP Solution** 

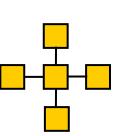

## **Recap: Energy Formulation**

#### **Energy function**

$$E(\mathbf{x},\mathbf{y}) = \sum_{i} \phi(x_i,y_i) + \sum_{i,j} \psi(x_i,x_j)$$
Unary Pairwise potentials

- Unary potentials  $\phi$ 
  - Encode local information about the given pixel/patch
  - How likely is a pixel/patch to belong to a certain class (e.g. foreground/background)?
- Pairwise potentials  $\psi$ 
  - Encode neighborhood information
  - How different is a pixel/patch's label from that of its neighbor? (e.g. based on intensity/color/texture difference, edges)

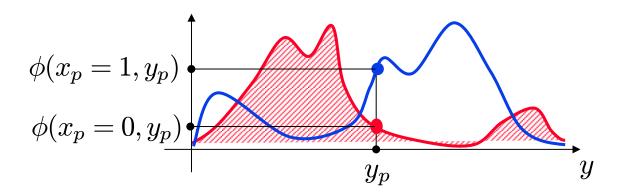

## Recap: How to Set the Potentials?

- Unary potentials
  - E.g. color model, modeled with a Mixture of Gaussians

$$\phi(x_i, y_i; \theta_{\phi}) = \log \sum_{k} \theta_{\phi}(x_i, k) p(k|x_i) \mathcal{N}(y_i; \bar{y}_k, \Sigma_k)$$

⇒ Learn color distributions for each label

## Recap: How to Set the Potentials?

#### Pairwise potentials

> Potts Model

$$\psi(x_i, x_j; \theta_{\psi}) = \theta_{\psi} \delta(x_i \neq x_j)$$

- Simplest discontinuity preserving model.
- Discontinuities between any pair of labels are penalized equally.
- Useful when labels are unordered or number of labels is small.
- Extension: "Contrast sensitive Potts model"

$$\psi(x_i, x_j, g_{ij}(y); \theta_{\psi}) = \theta_{\psi} g_{ij}(y) \delta(x_i \neq x_j)$$

where

$$g_{ij}(y) = e^{-\beta \|y_i - y_j\|^2}$$
  $\beta = 2 / avg(\|y_i - y_j\|^2)$ 

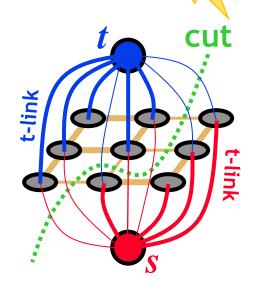

⇒ Discourages label changes except in places where there is also a large change in the observations.

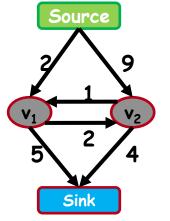

## Recap: Graph-Cuts Energy Minimization See 3.41

- Solve an equivalent graph cut problem
  - 1. Introduce extra nodes: source and sink
  - 2. Weight connections to source/sink (t-links) by  $\phi(x_i=s)$  and  $\phi(x_i=t)$ , respectively.
  - 3. Weight connections between nodes (n-links) by  $\psi(x_i,\,x_j)$ .
  - 4. Find the minimum cost cut that separates source from sink.
  - ⇒ Solution is equivalent to minimum of the energy.

- Dual to the well-known max flow problem
- Very efficient algorithms available for regular grid graphs (1-2 MPixels/s)
- Globally optimal result for 2-class problems

## Recap: When Can s-t Graph Cuts Be Applied?

Unary potentials Pairwise potentials 
$$E(L) = \sum_p E_p(L_p) + \sum_{pq \in N} E(L_p, L_q)$$
 
$$\text{t-links} \qquad \text{n-links} \qquad L_p \in \{s, t\}$$

• s-t graph cuts can only globally minimize binary energies that are submodular. [Boros & Hummer, 2002, Kolmogorov & Zabih, 2004]

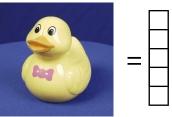

$$\longleftrightarrow E(s,s) + E(t,t) \le E(s,t) + E(t,s)$$
Submodularity ("convexity")

- Submodularity is the discrete equivalent to convexity.
  - Implies that every local energy minimum is a global minimum.
  - ⇒ Solution will be globally optimal.

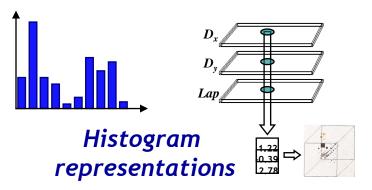

## Repetition

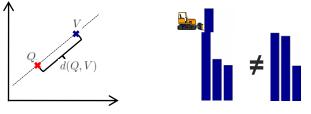

- Image Processing Basics
- Segmentation & Grouping
- Object Recognition
  - > Global Representations
- Local Features & Matching
- Object Categorization
- 3D Reconstruction
- Motion and Tracking

#### Appearance-based recognition

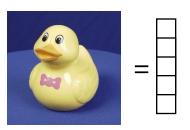

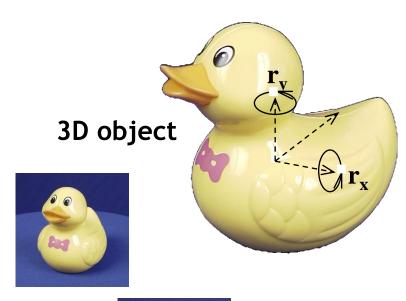

Comparison measures

## Recap: Appearance-Based Recognition

#### Basic assumption

- Objects can be represented by a set of images ("appearances").
- For recognition, it is sufficient to just compare the 2D appearances.
- No 3D model is needed.

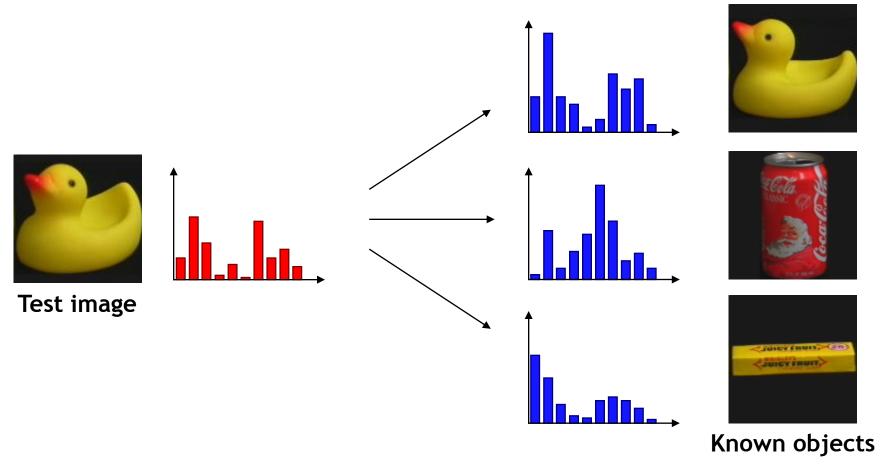

⇒ Fundamental paradigm shift in the 90's

## Recap: Recognition Using Global Features

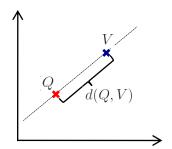

• E.g. histogram comparison

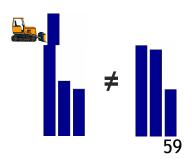

## Recap: Comparison Measures

- Vector space interpretation
  - Euclidean distance
- Statistical motivation
  - Chi-square
  - Bhattacharyya
- Information-theoretic motivation
  - Kullback-Leibler divergence, Jeffreys divergence
- Histogram motivation
  - Histogram intersection
- Ground distance
  - Earth Movers Distance (EMD)

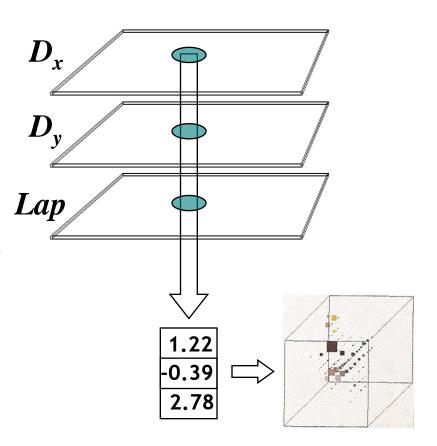

# Recap: Recognition Using Histograms Exercise 4.21

- Simple algorithm
  - Build a set of histograms  $H=\{h_i\}$  for each known object
    - More exactly, for each view of each object
  - Build a histogram  $h_t$  for the test image.
  - Compare  $h_i$  to each  $h_i \in H$ 
    - Using a suitable comparison measure
  - Select the object with the best matching score
    - Or reject the test image if no object is similar enough.

"Nearest-Neighbor" strategy

## Recap: Multidimensional Representations

- Combination of several descriptors
  - Each descriptor is applied to the whole image.
  - Corresponding pixel values are combined into one feature vector.
  - Feature vectors are collected in multidimensional histogram.

## **Recap: Colored Derivatives**

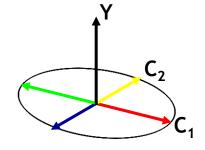

- Generalization: derivatives along
  - Y axis → intensity differences
  - $ightharpoonup C_1$  axis ightharpoonup red-green differences
  - $ightharpoonup C_2$  axis  $\rightarrow$  blue-yellow differences

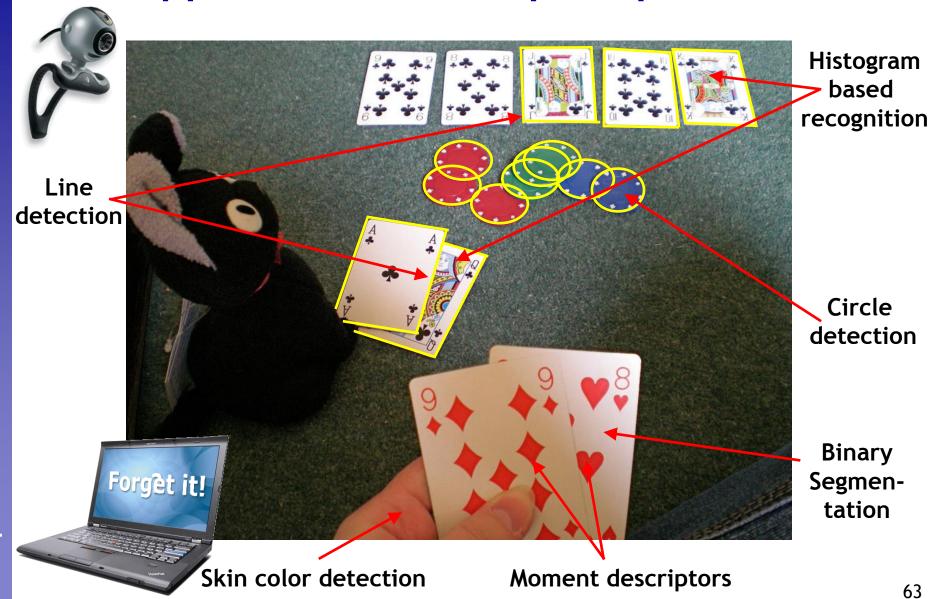

- Application:
  - Brand identification in video

## First Applications Take Up Shape...

  - Recognition with Local Features
- Object Categorization
- 3D Reconstruction
- Motion and Tracking

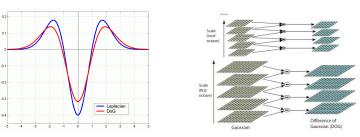

$$M(\sigma_I, \sigma_D) = g(\sigma_I) * \begin{bmatrix} I_x^2(\sigma_D) & I_x I_y(\sigma_D) \\ I_x I_y(\sigma_D) & I_y^2(\sigma_D) \end{bmatrix}$$

Harris & Hessian detector

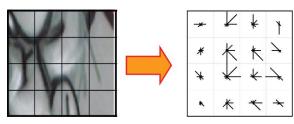

$$Hes(I) = \begin{bmatrix} I_{xx} & I_{xy} \\ I_{xy} & I_{yy} \end{bmatrix}$$

#### Laplacian scale selection

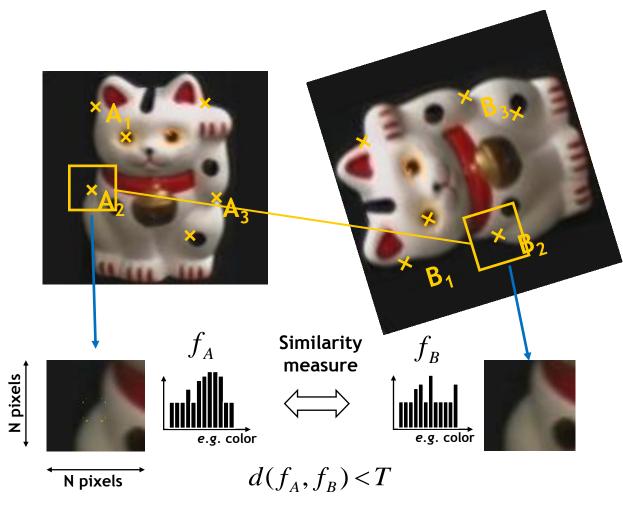

#### Difference-of-Gaussian (DoG)

SIFT descriptor

## Recap: Local Feature Matching Pipeline

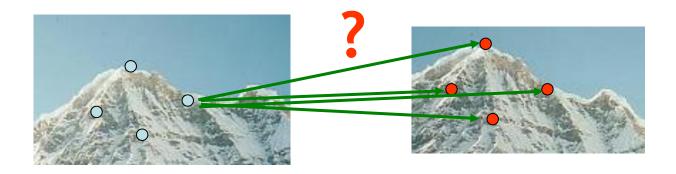

- Find a set of distinctive key-points
- 2. Define a region around each keypoint
- 3. Extract and normalize the region content
- Compute a local descriptor from the normalized region
- 5. Match local descriptors

## Recap: Requirements for Local Features

- Problem 1:
  - Detect the same point independently in both images
- Problem 2:
  - For each point correctly recognize the corresponding one

We need a repeatable detector!

We need a reliable and distinctive descriptor!

## Recap: Harris Detector [Harris88]

Compute second moment matrix (autocorrelation matrix)

$$M(\sigma_{I}, \sigma_{D}) = g(\sigma_{I}) * \begin{bmatrix} I_{x}^{2}(\sigma_{D}) & I_{x}I_{y}(\sigma_{D}) \\ I_{x}I_{y}(\sigma_{D}) & I_{y}^{2}(\sigma_{D}) \end{bmatrix}$$
 1. Image derivation

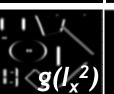

2. Square of

Exercise 5.2!

$$R = \det[M(\sigma_{I}, \sigma_{D})] - \alpha[\operatorname{trace}(M(\sigma_{I}, \sigma_{D}))]$$

$$= g(I_{x}^{2})g(I_{y}^{2}) - [g(I_{x}I_{y})]^{2} - \alpha[g(I_{x}^{2}) + g(I_{y}^{2})]^{2}$$

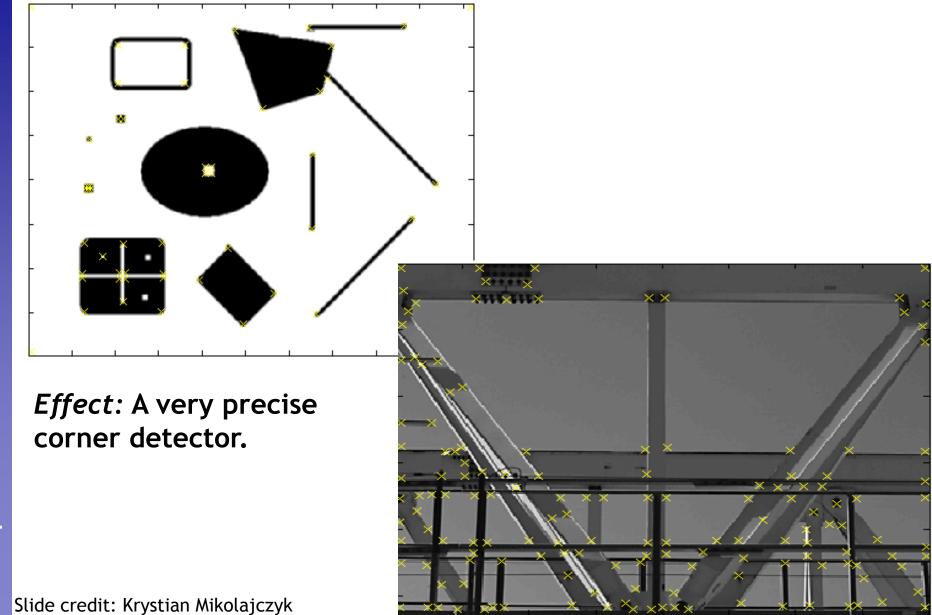

5. Perform non-maximum suppression

B. Leibe

## Recap: Harris Detector Responses [Harris88]

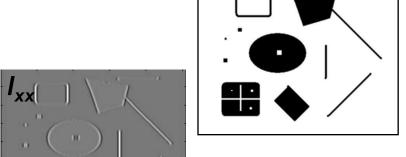

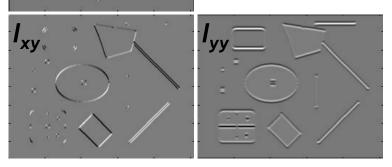

## Recap: Hessian Detector [Beaudet78]

Hessian determinant

$$Hessian(I) = \begin{bmatrix} I_{xx} & I_{xy} \\ I_{xy} & I_{yy} \end{bmatrix}$$

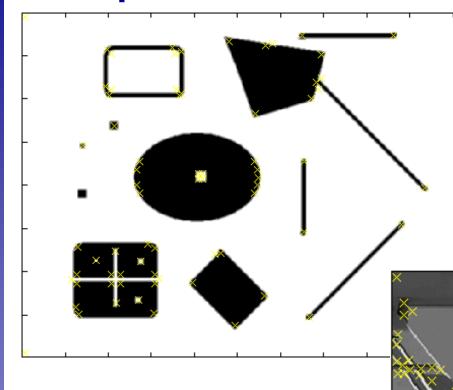

$$\det(Hessian(I)) = I_{xx}I_{yy} - I_{xy}^2$$

In Matlab:

$$I_{xx} \cdot *I_{yy} - (I_{xy})^2$$

## Recap: Hessian Detector Responses [Beaudet78]

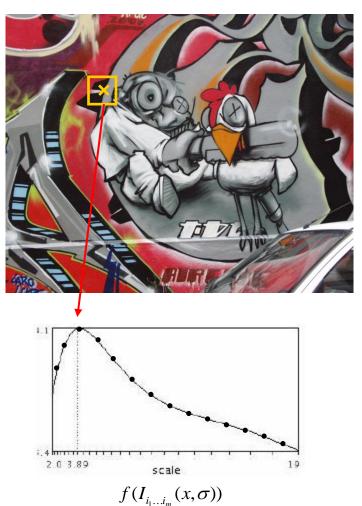

Effect: Responses mainly on corners and strongly textured areas.

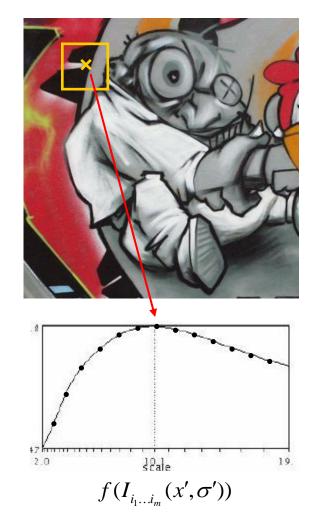

Slide credit: Krystian Mikolajczyk

## Recap: Automatic Scale Selection

• Function responses for increasing scale (scale signature)

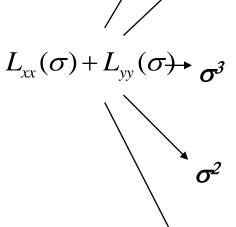

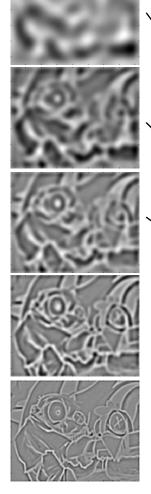

## Recap: Laplacian-of-Gaussian (LoG)

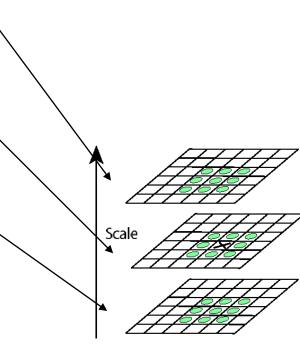

#### Interest points:

 Local maxima in scale space of Laplacian-of-Gaussian

 $\sigma$ 

# Recap: LoG Detector Responses

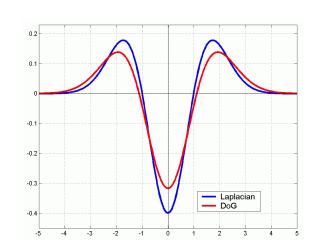

# Recap: Key point localization with DoG

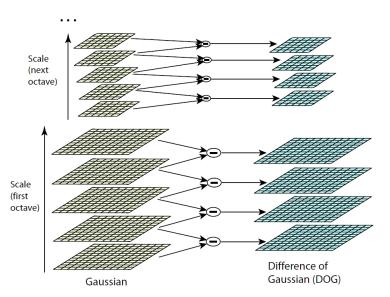

### Efficient implementation

 Approximate LoG with a difference of Gaussians (DoG)

- Detect maxima of differenceof-Gaussian in scale space
- Reject points with low contrast (threshold)
- Eliminate edge responses

Candidate keypoints: list of  $(x,y,\sigma)$ 

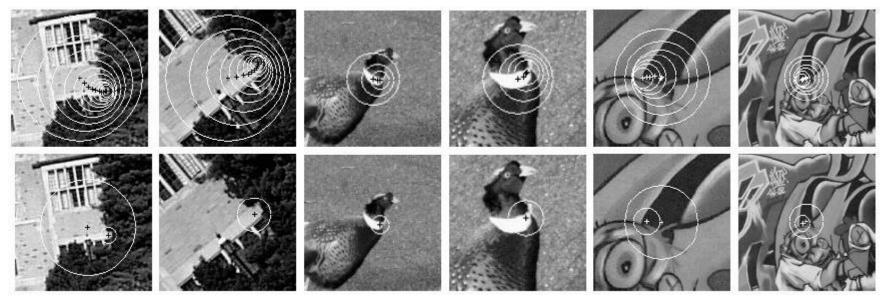

Image source: David Lowe

### Recap: Harris-Laplace [Mikolajczyk '01]

- 1. Initialization: Multiscale Harris corner detection
- Scale selection based on Laplacian (same procedure with Hessian ⇒ Hessian-Laplace)

#### Harris points

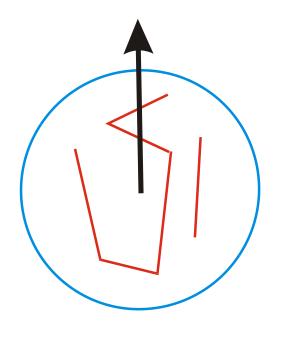

Harris-Laplace points

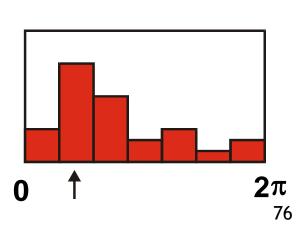

# **Recap: Orientation Normalization**

- Compute orientation histogram
- Select dominant orientation
- Normalize: rotate to fixed orientation

[Lowe, SIFT, 1999

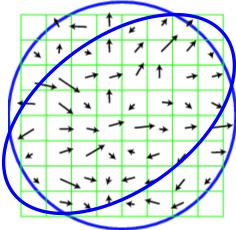

# **Recap: Affine Adaptation**

#### Problem:

- Determine the characteristic shape of the region.
- Assumption: shape can be described by "local affine frame".
- Solution: iterative approach
  - Use a circular window to compute second moment matrix.
  - Compute eigenvectors to adapt the circle to an ellipse.
  - Recompute second moment matrix using new window and iterate...

78

# Recap: Iterative Affine Adaptation

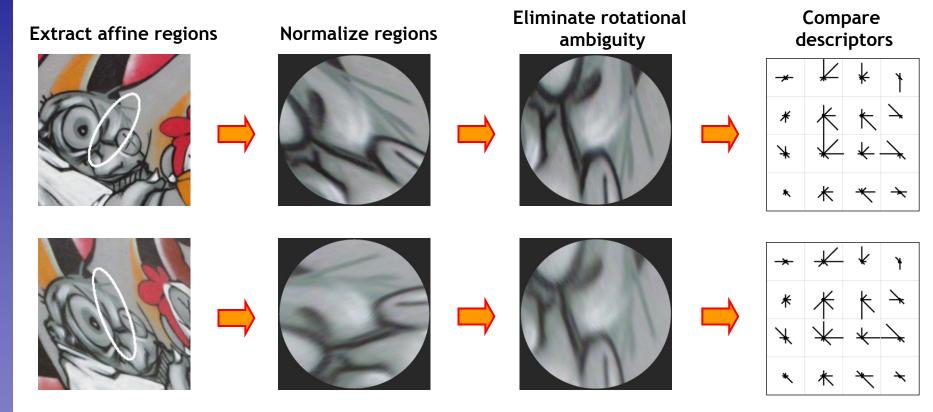

- Detect keypoints, e.g. multi-scale Harris
- 2. Automatically select the scales
- Adapt affine shape based on second order moment matrix 3.
- Refine point location

K. Mikolajczyk and C. Schmid, Scale and affine invariant interest point detectors, IJCV 60(1):63-86, 2004. Slide credit: Tinne Tuytelaars

#### RWTHAACHEN UNIVERSITY

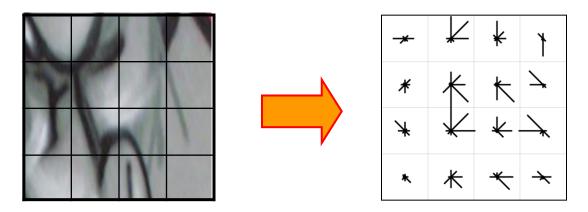

# Recap: Affine-Inv. Feature Extraction

# Recap: SIFT Feature Descriptor

- Scale Invariant Feature Transform
- Descriptor computation:
  - Divide patch into 4x4 sub-patches: 16 cells
  - Compute histogram of gradient orientations (8 reference angles) for all pixels inside each sub-patch
  - Resulting descriptor: 4x4x8 = 128 dimensions

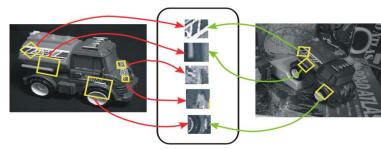

David G. Lowe. "Distinctive image features from scale-invariant keypoints." IJCV 60 (2), pp. 91-110, 2004.

### RWTHAACHEN UNIVERSITY

### Recap: Recognition with Local Features

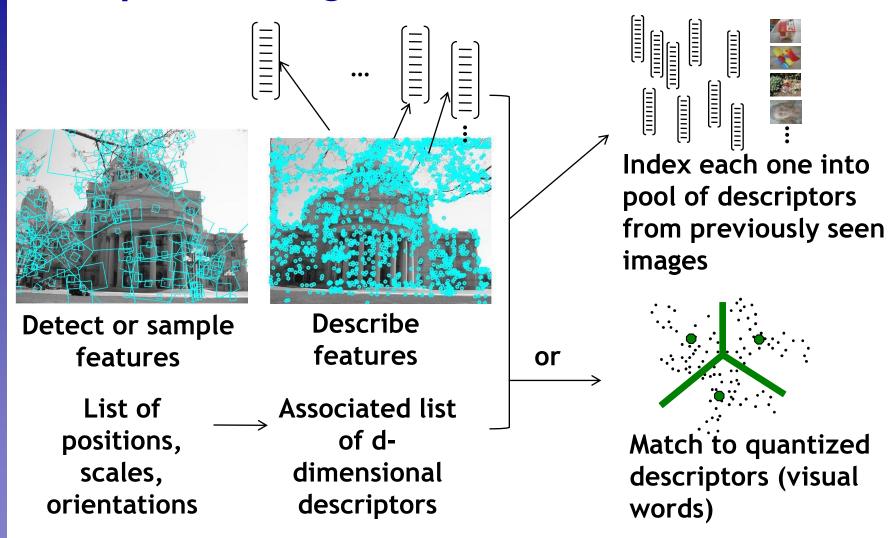

- Image content is transformed into local features that are invariant to translation, rotation, and scale
- Goal: Verify if they belong to a consistent configuration

Local Features, e.g. SIFT

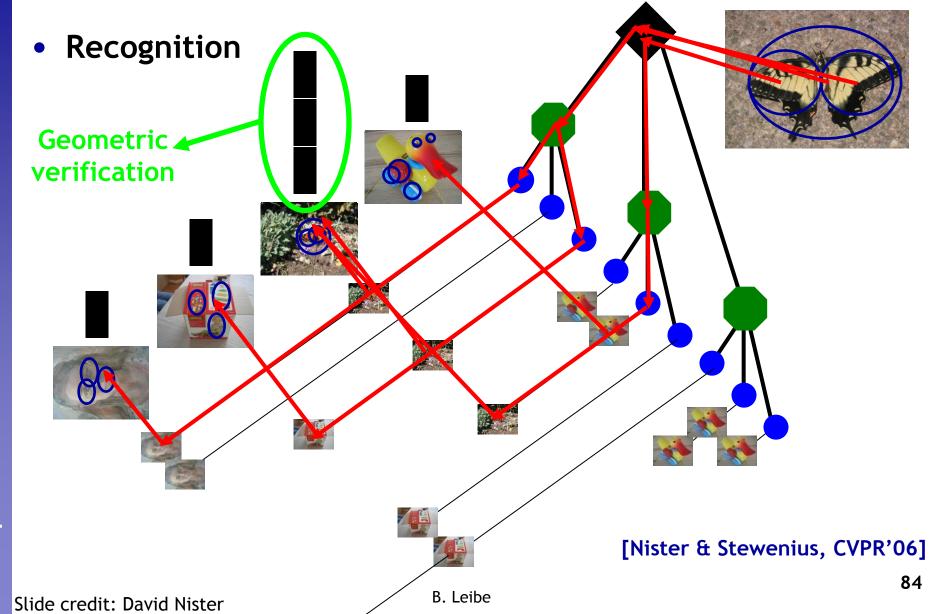

# Recap: Indexing features

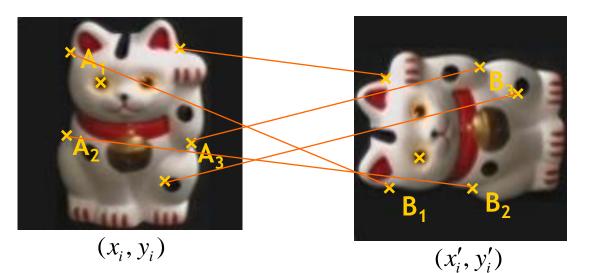

⇒ Shortlist of possibly matching images + feature correspondences

# Recap: Fast Indexing with Vocabulary Trees

# Recap: Fitting an Affine Transformation

 Assuming we know the correspondences, how do we get the transformation?

$$\begin{bmatrix} x_i' \\ y_i' \end{bmatrix} = \begin{bmatrix} m_1 & m_2 \\ m_3 & m_4 \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} + \begin{bmatrix} t_1 \\ t_2 \end{bmatrix} \qquad \begin{bmatrix} x_i & y_i & 0 & 0 & 1 & 0 \\ 0 & 0 & x_i & y_i & 0 & 1 \\ & & \cdots & & & \end{bmatrix} \begin{bmatrix} m_1 \\ m_2 \\ m_3 \\ m_4 \\ t_1 \end{bmatrix} = \begin{bmatrix} \cdots \\ x_i' \\ y_i' \\ \cdots \end{bmatrix}$$

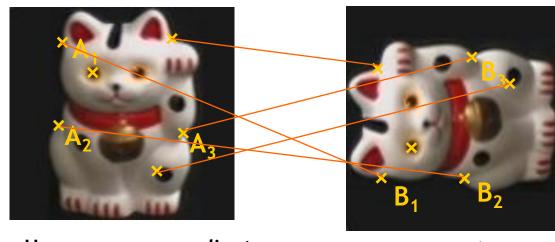

B. Leibe

$$m_1$$
 $m_2$ 
 $m_3$ 
 $m_4$ 
 $t_1$ 
 $=$ 
 $\begin{bmatrix} \cdots \\ x'_i \\ y'_i \\ \cdots \end{bmatrix}$ 

# Recap: Fitting a Homography

Estimating the transformation

Homogenous coordinates

 $x_{A_{1}} = \frac{h_{11} x_{B_{1}} + h_{12} y_{B_{1}} + h_{13}}{h_{31} x_{B_{1}} + h_{32} y_{B_{1}} + 1}$ 

 $\mathbf{X}_{A_{1}} \leftrightarrow \mathbf{X}_{B_{1}}$   $\mathbf{X}_{A_{2}} \leftrightarrow \mathbf{X}_{B_{2}}$   $\mathbf{X}_{A_{3}} \leftrightarrow \mathbf{X}_{B_{3}}$   $z' = \begin{bmatrix} h_{11} & h_{12} & h_{13} \\ y' = h_{21} & h_{22} & h_{23} \end{bmatrix} y$   $z' = \begin{bmatrix} h_{31} & h_{32} & 1 \end{bmatrix}$ 

Image coordinates

$$y''_{A_{1}} = \frac{1}{z'} y'_{A_{1}} = \frac{h_{21} x_{B_{1}} + h_{22} y_{B_{1}} + h_{23}}{h_{31} x_{B_{1}} + h_{32} y_{B_{1}} + 1}$$
Matrix notation
$$x' = Hx$$

$$x'' = \frac{1}{z'} x'$$

# Recap: Fitting a Homography

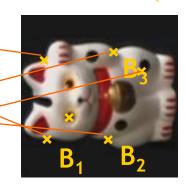

Exercise 5.5!

Estimating the transformation

$$h_{11} x_{B_1} + h_{12} y_{B_1} + h_{13} - x_{A_1} h_{31} x_{B_1} - x_{A_1} h_{32} y_{B_1} - x_{A_1} = 0$$

$$h_{21} x_{B_1} + h_{22} y_{B_1} + h_{23} - y_{A_1} h_{31} x_{B_1} - y_{A_1} h_{32} y_{B_1} - y_{A_1} = 0$$

$$\mathbf{x}_{A_1} \longleftrightarrow \mathbf{x}_{B_1}$$
 $\mathbf{x}_{A_2} \longleftrightarrow \mathbf{x}_{B_2}$ 
 $\mathbf{x}_{A_3} \longleftrightarrow \mathbf{x}_{B_3}$ 

$$\begin{bmatrix} x_{B_1} & y_{B_1} & 1 & 0 & 0 & 0 & -x_{A_1}x_{B_1} & -x_{A_1}y_{B_1} & -x_{A_1} \\ 0 & 0 & 0 & x_{B_1} & y_{B_1} & 1 & -y_{A_1}x_{B_1} & -y_{A_1}y_{B_1} & -y_{A_1} \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ h_{13} & h_{21} & h_{21} & h_{21} \\ h_{22} & \vdots & \vdots & \vdots & \vdots \\ h_{23} & h_{31} & \vdots & \vdots \end{bmatrix}$$

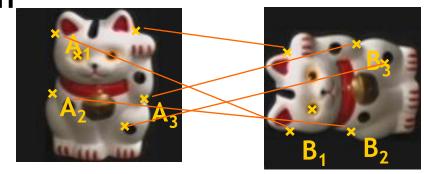

$$\begin{bmatrix} h_{11} \\ h_{12} \\ h_{13} \\ h_{21} \\ h_{22} \\ h_{23} \\ h_{31} \\ h_{32} \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ . \\ . \\ . \end{bmatrix}$$

Ah=0

# Recap: Fitting a Homography

- Estimating the transformation
- Solution:
  - Null-space vector of A
  - Corresponds to smallest eigenvector

$$\mathbf{X}_{A_1} \longleftrightarrow \mathbf{X}_{B_1}$$
 $\mathbf{X}_{A_2} \longleftrightarrow \mathbf{X}_{B_2}$ 
 $\mathbf{X}_{A_3} \longleftrightarrow \mathbf{X}_{B_3}$ 
 $\vdots$ 

SVD 
$$Ah = 0$$

$$\downarrow A = \mathbf{U}\mathbf{D}\mathbf{V}^T = \mathbf{U} \begin{bmatrix} d_{11} & \cdots & d_{19} \\ \vdots & \ddots & \vdots \\ d_{91} & \cdots & d_{99} \end{bmatrix} \begin{bmatrix} v_{11} & \cdots & v_{19} \\ \vdots & \ddots & \vdots \\ v_{91} & \cdots & v_{99} \end{bmatrix}^T$$

$$\mathbf{h} = \frac{\left[v_{19}, \cdots, v_{99}\right]}{v_{99}}$$

Minimizes least square error

# Recap: RANSAC

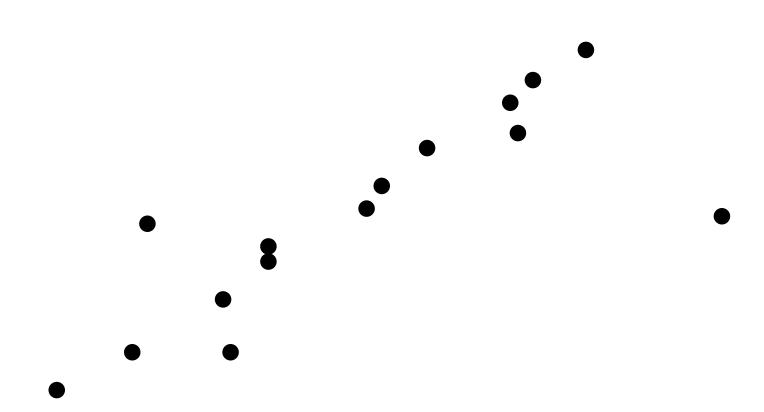

### **RANSAC loop:**

- Randomly select a seed group of points on which to base transformation estimate (e.g., a group of matches)
- 2. Compute transformation from seed group
- Find inliers to this transformation
- 4. If the number of inliers is sufficiently large, recompute least-squares estimate of transformation on all of the inliers
  - Keep the transformation with the largest number of inliers

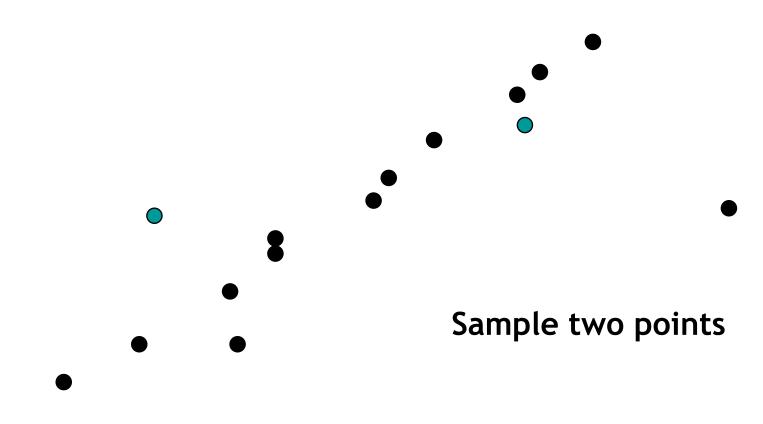

Task: Estimate the best line

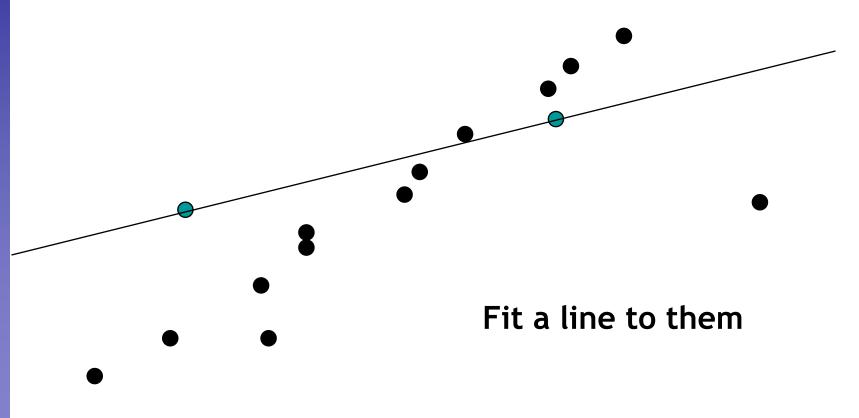

Task: Estimate the best line

# Recap: Feature Matching Example

- Find best stereo match within a square search window (here 300 pixels<sup>2</sup>)
- Global transformation model: epipolar geometry

before RANSAC

after RANSAC

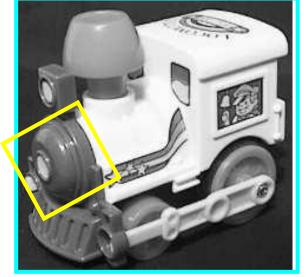

Images from Hartley & Zisserman

### RWTHAACHEN UNIVERSITY

# Recap: Generalized Hough Transform

- Suppose our features are scale- and rotation-invariant
  - > Then a single feature match provides an alignment hypothesis (translation, scale, orientation).

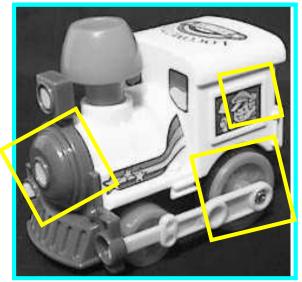

B. Leibe

### RWTHAACHEN UNIVERSITY

# Recap: Generalized Hough Transform

- Suppose our features are scale- and rotation-invariant
  - > Then a single feature match provides an alignment hypothesis (translation, scale, orientation).
  - Of course, a hypothesis from a single match is unreliable.
  - Solution: let each match vote for its hypothesis in a Hough space with very coarse bins.

**HOG** detector

**Viola-Jones face detector** 

# Recap: Sliding-Window Object Detection

 If object may be in a cluttered scene, slide a window around looking for it.

 Essentially, this is a brute-force approach with many local decisions.

# Recap: Gradient-based Representations

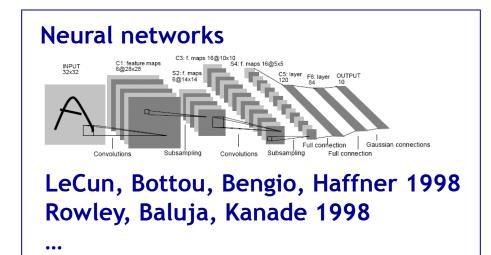

Consider edges, contours, and (oriented) intensity gradients

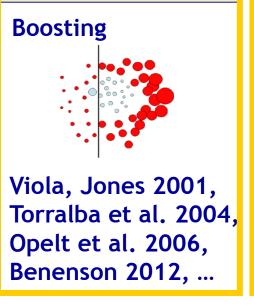

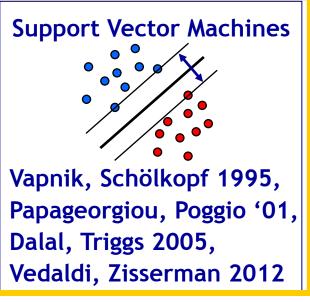

- Summarize local distribution of gradients with histogram
  - Locally orderless: offers invariance to small shifts and rotations
  - Contrast-normalization: try to correct for variable illumination

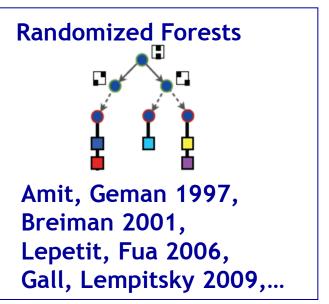

# Recap: Classifier Construction: Many Choices...

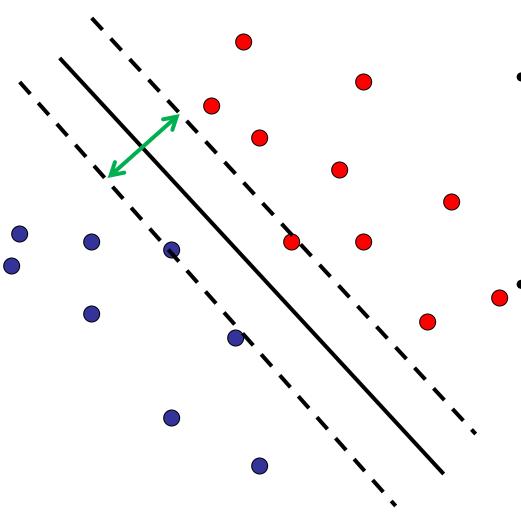

### RWTHAACHEN UNIVERSITY

# Recap: Support Vector Machines (SVMs)

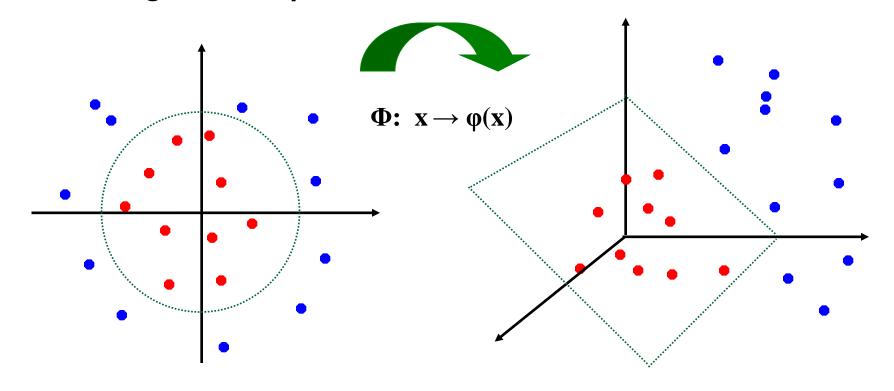

- Discriminative classifier based on optimal separating hyperplane (i.e. line for 2D case)
- Maximize the margin between the positive and negative training examples

# Recap: Non-Linear SVMs

 General idea: The original input space can be mapped to some higher-dimensional feature space where the training set is separable:

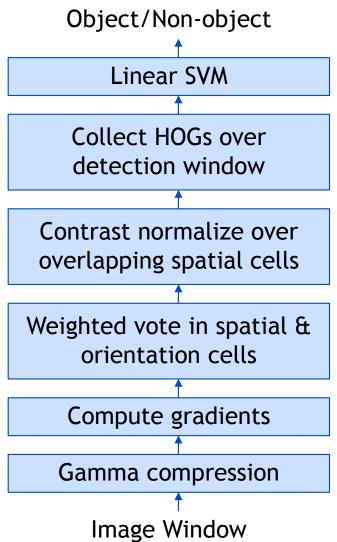

# Recap: HOG Descriptor Processing Chain

- SVM Classification
  - Typically using a linear SVM

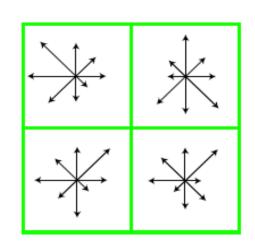

# **Recap: HOG Cell Computation Details**

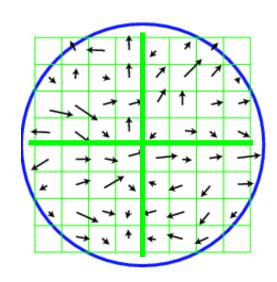

- Gradient orientation voting
  - Each pixel contributes to localized gradient orientation histogram(s)
  - Vote is weighted by the pixel's gradient magnitude

$$\theta = \tan^{-1}\left(\frac{\partial f}{\partial y} / \frac{\partial f}{\partial x}\right)$$
$$\|\nabla f\| = \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2}$$

- Block-level Gaussian weighting
  - An additional Gaussian weight is applied to each 2×2 block of cells
  - Each cell is part of 4 such blocks, resulting in 4 versions of the histogram.

### RWTHAACHEN UNIVERSITY

# Recap: HOG Cell Computation Details (2)

- Important for robustness: Tri-linear interpolation
  - Each pixel contributes to (up to) 4 neighboring cell histograms
  - Weights are obtained by bilinear interpolation in image space:

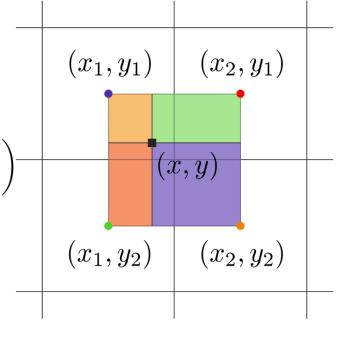

$$h(x_1, y_1) \leftarrow w \cdot \left(1 - \frac{x - x_1}{x_2 - x_1}\right) \left(1 - \frac{y - y_1}{y_2 - y_1}\right)^{-1}$$

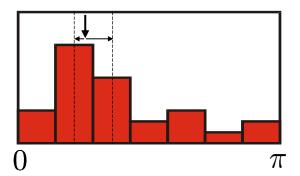

$$h(x_1, y_2) \leftarrow w \cdot \left(1 - \frac{x - x_1}{x_2 - x_1}\right) \left(\frac{y - y_1}{y_2 - y_1}\right)$$

$$h(x_2, y_1) \leftarrow w \cdot \left(\frac{x - x_1}{x_2 - x_1}\right) \left(1 - \frac{y - y_1}{y_2 - y_1}\right)$$

$$h(x_2, y_2) \leftarrow w \cdot \left(\frac{x - x_1}{x_2 - x_1}\right) \left(\frac{y - y_1}{y_2 - y_1}\right)$$

 Contribution is further split over (up to) 2 neighboring orientation bins via linear interpolation over angles.

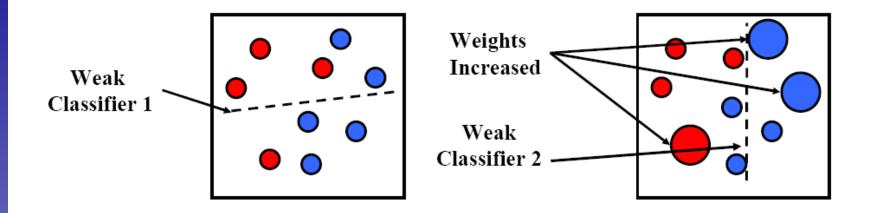

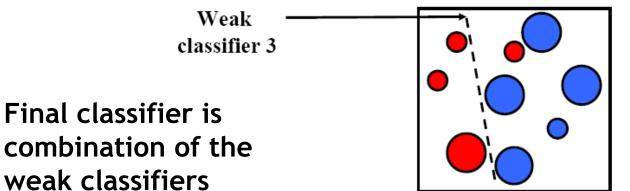

# Recap: Non-Maximum Suppression

### Recap: AdaBoost

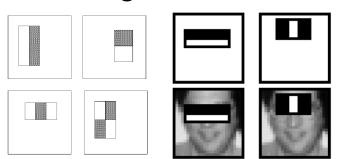

109

### **Recap: Viola-Jones Face Detection**

#### "Rectangular" filters

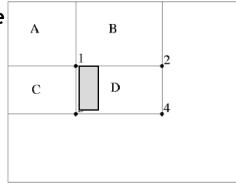

Feature output is difference between adjacent regions

Efficiently computable with integral image: any sum can be computed in constant time

Avoid scaling images  $\rightarrow$  scale features directly for same cost

Value at (x,y) is sum of pixels above and to the left of (x,y)

Integral image

$$D = 1 + 4 - (2 + 3)$$

$$= A + (A + B + C + D) - (A + C + A + B)$$

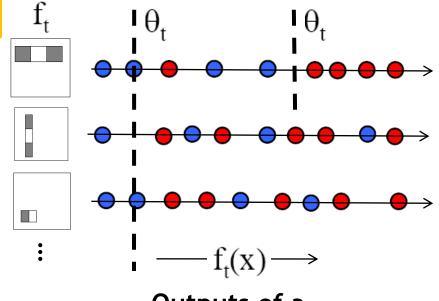

$$= D$$

[Viola & Jones, CVPR 2001]

B. Leibe

# Recap: AdaBoost Feature+Classifier Selection

 Want to select the single rectangle feature and threshold that best separates positive (faces) and negative (nonfaces) training examples, in terms of weighted error.

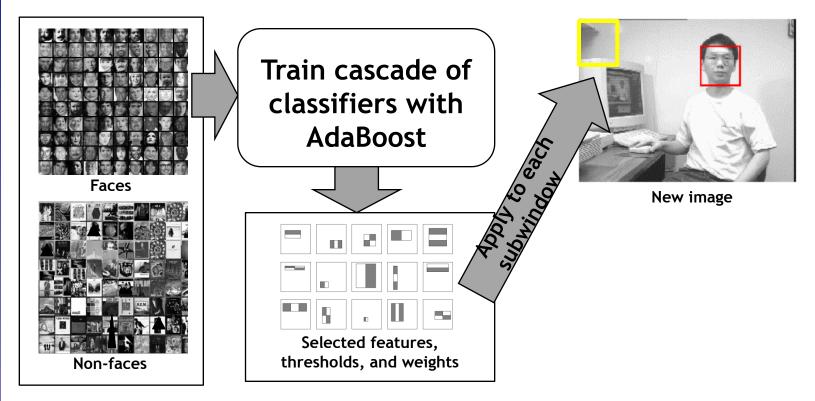

Outputs of a possible rectangle feature on faces and non-faces.

Resulting weak classifier:

$$h_{t}(x) = \begin{cases} +1 & \text{if } f_{t}(x) > \theta_{t} \\ -1 & \text{otherwise} \end{cases}$$

For next round, reweight the examples according to errors, choose another filter/threshold combo.

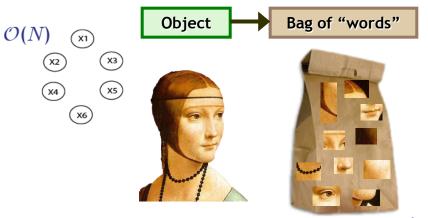

#### **Application: Viola-Jones Face Detector**

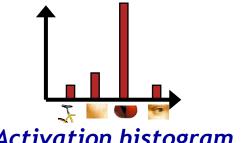

- Train with 5K positives, 350M negatives
- Real-time detector using 38 layer cascade
- 6061 features in final layer
- [Implementation available in OpenCV: http://sourceforge.net/projects/opencvlibrary/]

**Bag-of-words representation** 

Activation histogram

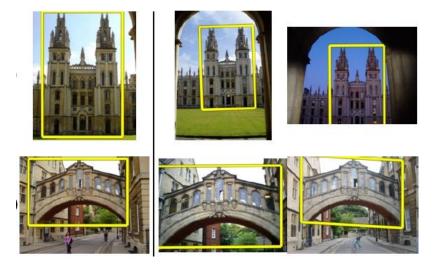

# Recap: Identification vs. Categorization

Find this particular object

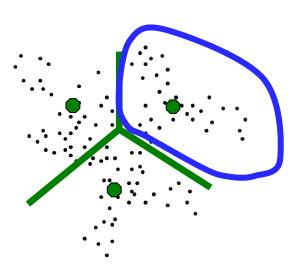

Recognize ANY cow

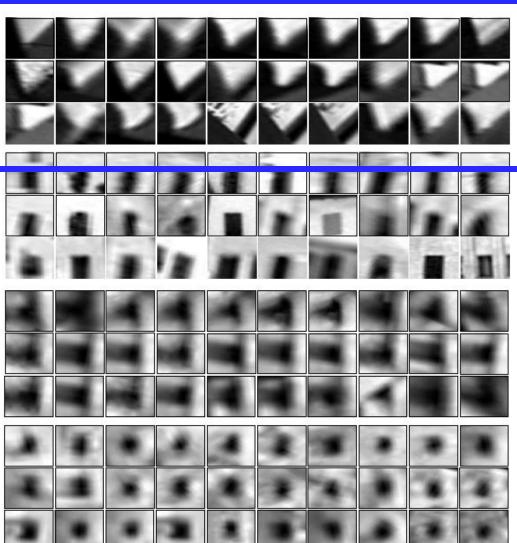

Recap: Visual Words

- Quantize the feature space into "visual words"
- Perform matching only to those visual words.

Exact feature matching  $\rightarrow$  Match to same visual word

# Recap: Bag-of-Word Representations (BoW)

Object Bag of "words"

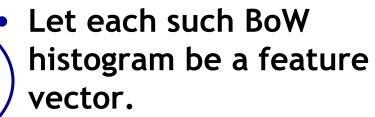

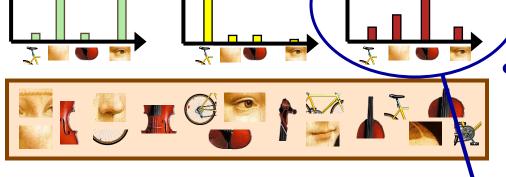

# Recap: Categorization with Bags-of-Words

 Compute the word activation histogram for each image.

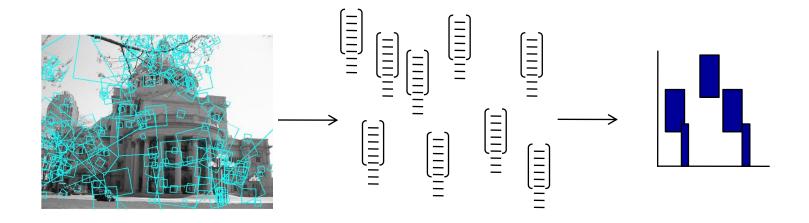

Use images from each class to train a classifier (e.g., an SVM).

**Violins** 

# Recap: Advantage of BoW Histograms

 Bag of words representations make it possible to describe the unordered point set with a single vector (of fixed dimension across image examples).

 Provides easy way to use distribution of feature types with various learning algorithms requiring vector input.

### **Limitations of BoW Representations**

- The bag of words removes spatial layout.
- This is both a strength and a weakness.

- Why a strength?
- Why a weakness?

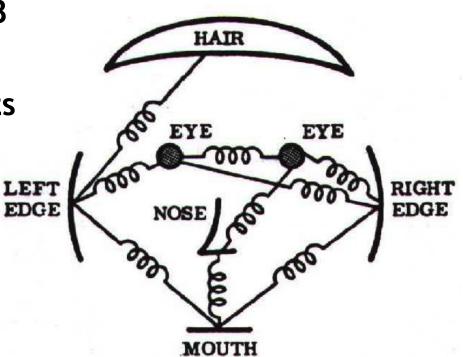

### **Recap: Part-Based Models**

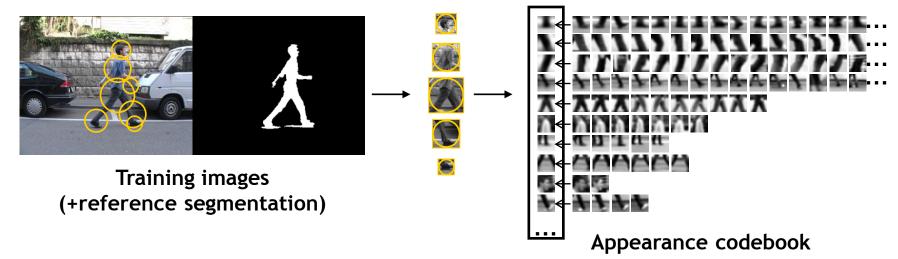

• Fischler & Elschlager 1973

Model has two components

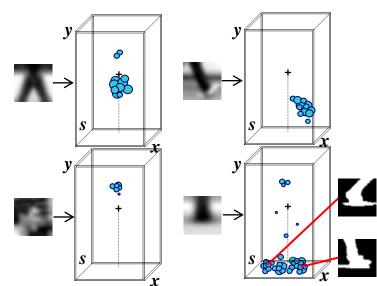

- parts(2D image fragments)
- structure (configuration of parts)

#### Recap: Implicit Shape Model - Representation

AlexNet, VGGNet, GoogLeNet

# Recap: Convolutional Neural Networks

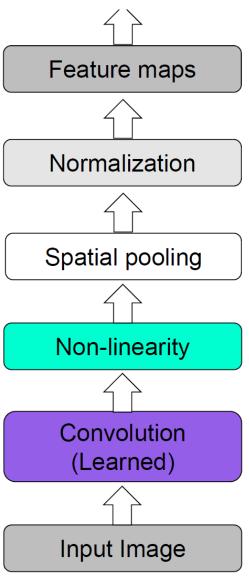

- Neural network with specialized connectivity structure
  - Stack multiple stages of feature extractors
  - Higher stages compute more global, more invariant features
  - Classification layer at the end

Y. LeCun, L. Bottou, Y. Bengio, and P. Haffner, <u>Gradient-based learning applied to document recognition</u>, Proceedings of the IEEE 86(11): 2278-2324, 1998.

### **Recap: CNN Structure**

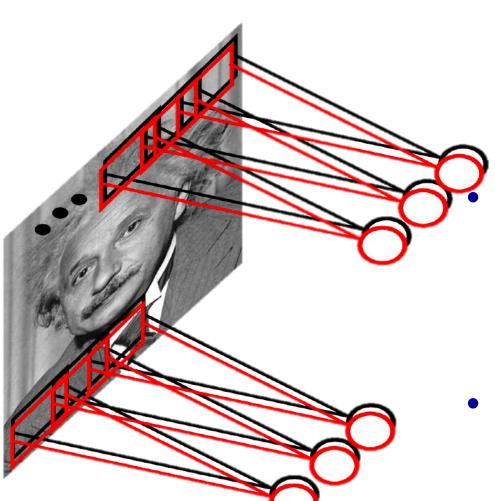

- Feed-forward feature extraction
  - 1. Convolve input with learned filters
  - 2. Non-linearity
  - 3. Spatial pooling
  - 4. (Normalization)
- Supervised training of convolutional filters by back-propagating classification error

### Recap: Intuition of CNNs

#### Convolutional net

- Share the same parameters across different locations
- Convolutions with learned kernels

#### Learn *multiple* filters

- E.g.  $1000 \times 1000$  image 100 filters  $10 \times 10$  filter size
- ⇒ only 10k parameters
- Result: Response map

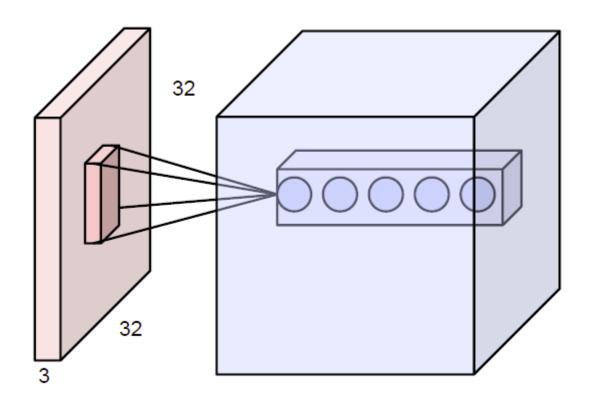

B. Leibe

- $\rightarrow$  size:  $1000 \times 1000 \times 100$
- Only memory, not params!

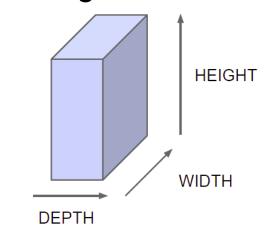

127

#### **Recap: Convolution Layers**

#### Naming convention:

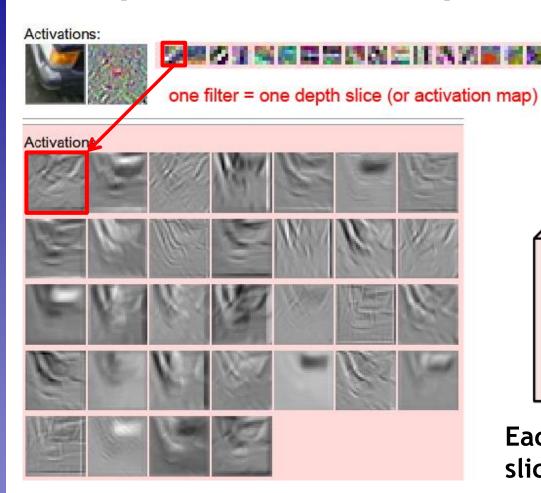

- All Neural Net activations arranged in 3 dimensions
  - Multiple neurons all looking at the same input region, stacked in depth
  - Form a single  $[1 \times 1 \times depth]$  depth column in output volume.

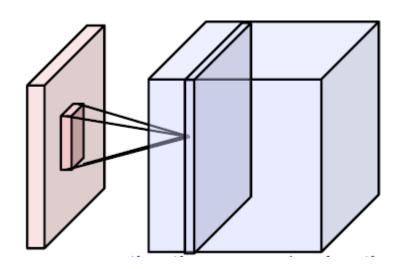

5×5 filters

#### **Recap: Activation Maps**

Each activation map is a depth slice through the output volume.

#### Recap: Pooling Layers

#### Single depth slice

				\ <u>'</u>

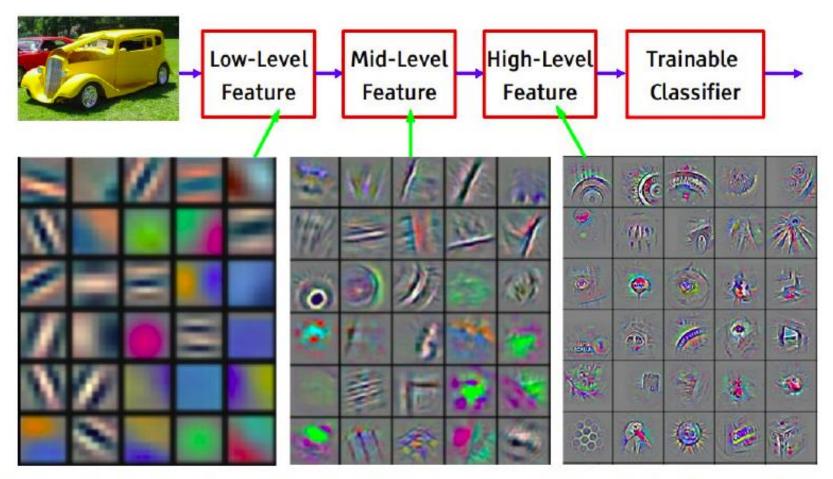

max pool with 2x2 filters and stride 2

6	8	
3	4	

#### Effect:

- Make the representation smaller without losing too much information
- Achieve robustness to translations

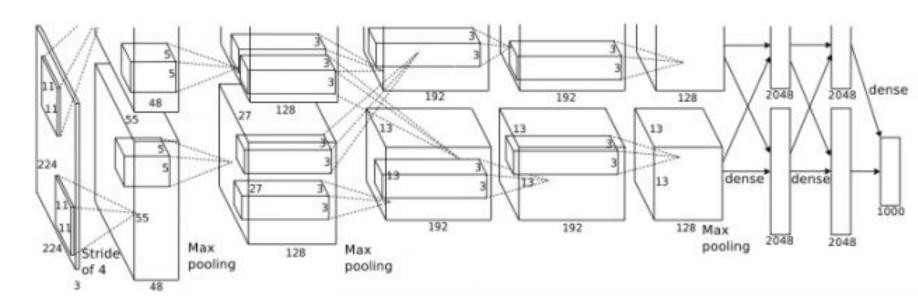

# Recap: Effect of Multiple Convolution Layers

Feature visualization of convolutional net trained on ImageNet from [Zeiler & Fergus 2013]

### Recap: AlexNet (2012)

- Similar framework as LeNet, but
  - Bigger model (7 hidden layers, 650k units, 60M parameters)
  - More data (10<sup>6</sup> images instead of 10<sup>3</sup>)
  - GPU implementation
  - Better regularization and up-to-date tricks for training (Dropout)

A. Krizhevsky, I. Sutskever, and G. Hinton, <u>ImageNet Classification with Deep</u> Convolutional Neural Networks, NIPS 2012.

# Recap: VGGNet (2014/15)

#### Main ideas

- Deeper network
- Stacked convolutional layers with smaller filters (+ nonlinearity)
- Detailed evaluation of all components

#### Results

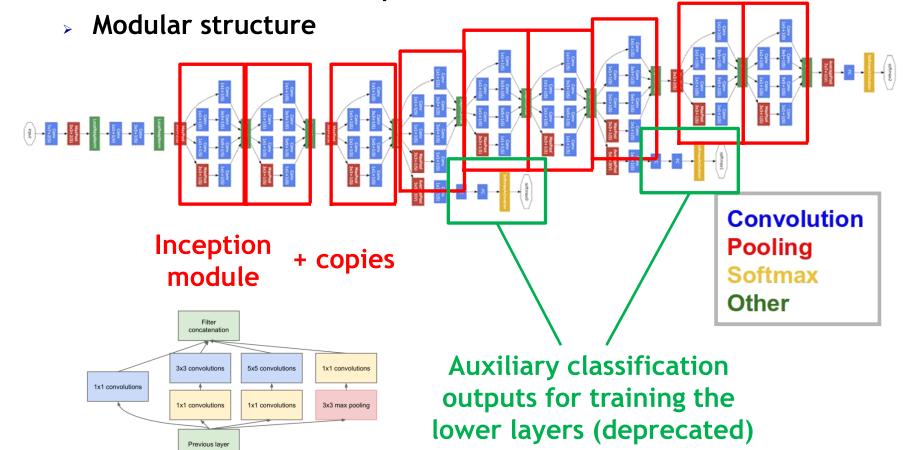

Improved ILSVRC top-5 error rate to 6.7%.

Dense stereo matching

# Recap: What Is Stereo Vision?

 Generic problem formulation: given several images of the same object or scene, compute a representation of

### Recap: Depth with Stereo - Basic Idea

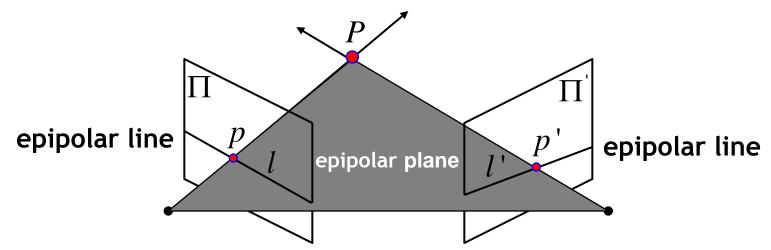

- Basic Principle: Triangulation
  - Gives reconstruction as intersection of two rays
  - Requires
    - Camera pose (calibration)
    - Point correspondence

138

### Recap: Epipolar Geometry

 Geometry of two views allows us to constrain where the corresponding pixel for some image point in the first view must occur in the second view.

- Epipolar constraint:
  - > Correspondence for point p in  $\Pi$  must lie on the epipolar line l in  $\Pi$  (and vice versa).
  - Reduces correspondence problem to 1D search along conjugate epipolar lines.

#### Recap: Stereo Geometry With Calibrated Cameras

 Camera-centered coordinate systems are related by known rotation R and translation T:

$$\mathbf{X'} = \mathbf{RX} + \mathbf{T}$$

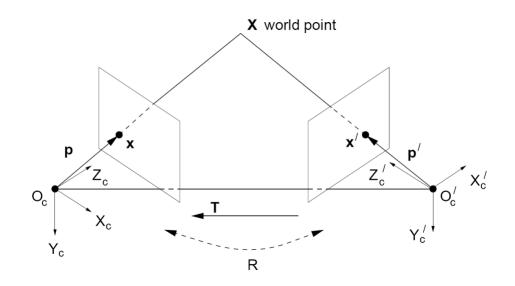

### Recap: Essential Matrix

$$\mathbf{X}' \cdot (\mathbf{T} \times \mathbf{R} \mathbf{X}) = 0$$

$$\mathbf{X}' \cdot \left(\mathbf{T}_x \ \mathbf{R}\mathbf{X}\right) = 0$$

Let 
$$\mathbf{E} = \mathbf{T}_{x}\mathbf{R}$$

$$\mathbf{X}'^T \mathbf{E} \mathbf{X} = 0$$

 This holds for the rays p and p' that are parallel to the camera-centered position vectors X and X', so we have:

$$\mathbf{p'}^T \mathbf{E} \mathbf{p} = 0$$

• E is called the essential matrix, which relates corresponding image points [Longuet-Higgins 1981]

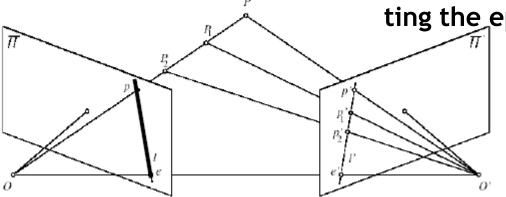

**-** 141

# Recap: Essential Matrix and Epipolar Lines

$$\mathbf{p'}^{\mathrm{T}}\mathbf{E}\mathbf{p} = 0$$

Epipolar constraint: if we observe point p in one image, then its position p' in second image must satisfy this equation.

l'=Ep is the coordinate vector representing the epipolar line for point p

(i.e., the line is given by:  $l'^{\top}\mathbf{x} = 0$ )

 $oldsymbol{l} oldsymbol{l} = oldsymbol{E}^T oldsymbol{p}'$  is the coordinate vector representing the epipolar line for point p'

Recap: Stereo Image Rectification

 In practice, it is convenient if image scanlines are the epipolar lines.

- Reproject image planes onto a common plane parallel to the line between optical centers
- Pixel motion is horizontal after this transformation
- Two homographies (3x3 transforms), one for each input image reprojection

#### Recap: Dense Correspondence Search

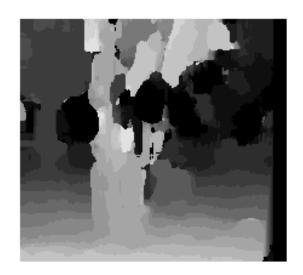

- For each pixel in the first image
  - Find corresponding epipolar line in the right image
  - Examine all pixels on the epipolar line and pick the best match (e.g. SSD, correlation)
  - Triangulate the matches to get depth information
- This is easiest when epipolar lines are scanlines
  - ⇒ Rectify images first

### Recap: Effect of Window Size

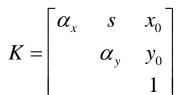

W = 3

W = 20

Want window large enough to have sufficient intensity variation, yet small enough to contain only pixels with about the same disparity.

Camera calibration

**Triangulation** 

Essential matrix, Fundamental matrix

$$x^T E x' = 0$$

$$x^T F x' = 0$$

$$\begin{bmatrix} u_1u_1' & u_1v_1' & u_1 & v_1u_1' & v_1v_1' & v_1 & u_1' & v_1' & 1 \\ u_2u_2' & u_2v_2' & u_2 & v_2u_2' & v_2v_2' & v_2 & u_2' & v_2' & 1 \\ u_3u_3' & u_3v_3' & u_3 & v_3u_3' & v_3v_3' & v_3 & u_3' & v_3' & 1 \\ u_4u_4' & u_4v_4' & u_4 & v_4u_4' & v_4v_4' & v_4 & u_4' & v_4' & 1 \\ u_5u_5' & u_5v_5' & u_5 & v_5u_5' & v_5v_5' & v_5 & u_5' & v_5' & 1 \\ u_6u_6' & u_6v_6' & u_6 & v_6u_6' & v_6v_6' & v_6 & u_6' & v_6' & 1 \\ u_7u_7' & u_7v_7' & u_7 & v_7u_7' & v_7v_7' & v_7 & u_7' & v_7' & 1 \\ u_8u_8' & u_8v_8' & u_8 & v_8u_8' & v_8v_8' & v_8 & u_8' & v_8' & 1 \end{bmatrix} \begin{bmatrix} F_{11} \\ F_{12} \\ F_{12} \\ F_{22} \\ F_{23} \\ F_{31} \\ F_{32} \end{bmatrix}$$

Eight-point algorithm

### Recap: A General Point

Equations of the form

$$Ax = 0$$

- How do we solve them? (always!)
  - Apply SVD

$$\mathbf{SVD} \downarrow \mathbf{A} = \mathbf{UDV}^T = \mathbf{U} \begin{bmatrix} d_{11} & & & \\ & \ddots & & \\ & & d_{NN} \end{bmatrix} \begin{bmatrix} v_{11} & \cdots & v_{1N} \\ \vdots & \ddots & \vdots \\ v_{N1} & \cdots & v_{NN} \end{bmatrix}^T$$

Singular values Singular vectors

 $\rightarrow$  Singular values of A = square roots of the eigenvalues of A<sup>T</sup>A.

B. Leibe

- The solution of Ax=0 is the nullspace vector of A.
- This corresponds to the smallest singular vector of A.

### **Recap: Camera Parameters**

#### Intrinsic parameters

- Principal point coordinates
- Focal length
- Pixel magnification factors
- Skew (non-rectangular pixels)
- Radial distortion

#### Extrinsic parameters

- Rotation R
- Translation t (both relative to world coordinate system)

#### Camera projection matrix

- ⇒ General pinhole camera:
- ⇒ CCD Camera with square pixels: 10 DoF
- ⇒ General camera: 11 DoF

$$P = K[R | t]$$

 $K = \begin{vmatrix} m_x & & & \\ & m_y & & \\ & & 1 \end{vmatrix} \begin{vmatrix} f & \mathbf{S} & p_x \\ & f & p_y \\ & & 1 \end{vmatrix} = \begin{vmatrix} \alpha_x & \mathbf{S} & x_0 \\ & \alpha_y & y_0 \\ & & 1 \end{vmatrix}$ 

B. Leibe

9 DoF

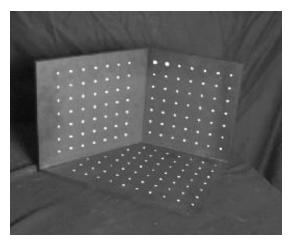

### Recap: Calibrating a Camera

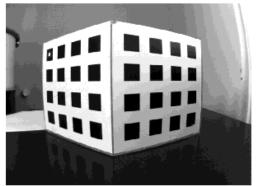

#### Goal

 Compute intrinsic and extrinsic parameters using observed camera data.

- Place "calibration object" with known geometry in the scene
- Get correspondences
- Solve for mapping from scene to image: estimate P=P<sub>int</sub>P<sub>ext</sub>

#### RWTHAACHEN UNIVERSITY

## Recap: Camera Calibration (DLT Algorithm)

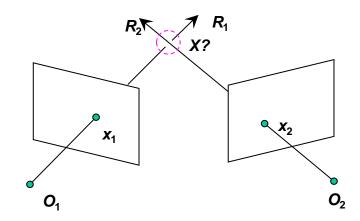

$$\begin{bmatrix} 0^{T} & X_{1}^{T} & -y_{1}X_{1}^{T} \\ X_{1}^{T} & 0^{T} & -x_{1}X_{1}^{T} \\ \cdots & \cdots & \cdots \\ 0^{T} & X_{n}^{T} & -y_{n}X_{n}^{T} \\ X_{n}^{T} & 0^{T} & -x_{n}X_{n}^{T} \end{bmatrix} \begin{pmatrix} P_{1} \\ P_{2} \\ P_{3} \end{pmatrix} = 0 \qquad Ap = 0$$

- P has 11 degrees of freedom.
- Two linearly independent equations per independent 2D/3D correspondence.
- Solve with SVD (similar to homography estimation)
  - Solution corresponds to smallest singular vector.
- 5 ½ correspondences needed for a minimal solution.

#### Recap: Triangulation - Lin. Alg. Approach

$$\lambda_1 X_1 = P_1 X$$

$$\lambda_1 x_1 = P_1 X \qquad x_1 \times P_1 X = 0$$

$$[x_{1\times}]P_1X = 0$$

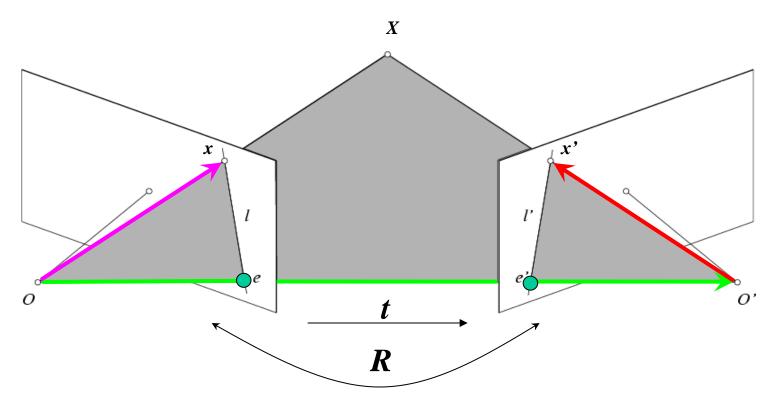

$$\lambda_2 X_2 = P_2 X$$

$$\mathbf{x}_2 \times \mathbf{P}_2 \mathbf{X} = 0$$

$$\lambda_2 x_2 = P_2 X$$
  $x_2 \times P_2 X = 0$   $[x_{2x}]P_2 X = 0$ 

- Two independent equations each in terms of three unknown entries of X.
- Stack equations and solve with SVD.
- This approach nicely generalizes to multiple cameras.

## Recap: Epipolar Geometry - Calibrated Case

#### Camera matrix: [I|0]

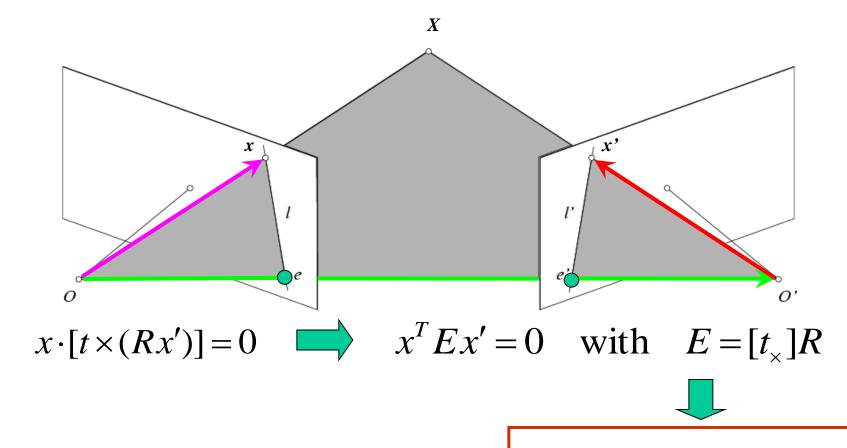

$$X = (u, v, w, 1)^T$$
$$x = (u, v, w)^T$$

Camera matrix:  $[R^T | -R^T t]$ Vector x' in second coord. system has coordinates Rx' in the first one.

The vectors x, t, and Rx are coplanar

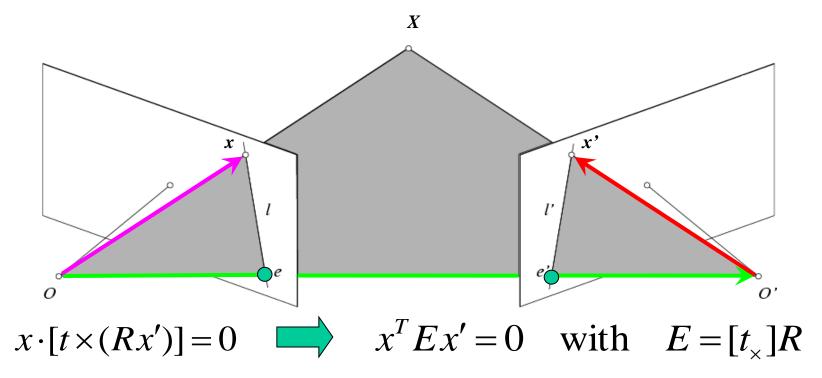

B. Leibe

## Recap: Epipolar Geometry - Calibrated Case

Essential Matrix (Longuet-Higgins, 1981)

### Recap: Epipolar Geometry - Calibrated Case

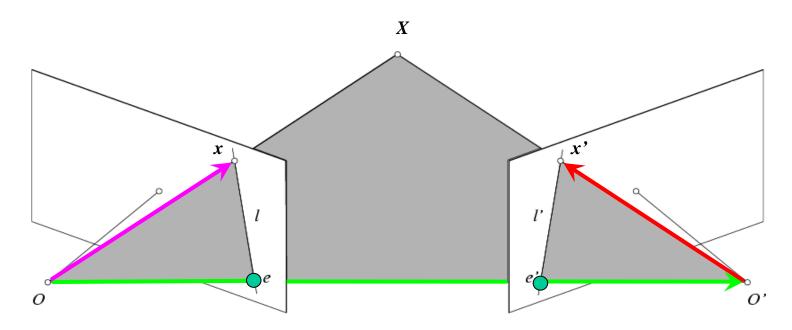

- E x' is the epipolar line associated with x' (l = E x')
- $E^Tx$  is the epipolar line associated with x ( $l' = E^Tx$ )
- E e' = 0 and  $E^{T}e = 0$
- E is singular (rank two)
- E has five degrees of freedom (up to scale)

154

#### RWTHAACHEN UNIVERSITY

#### Recap: Epipolar Geometry - Uncalibrated Case

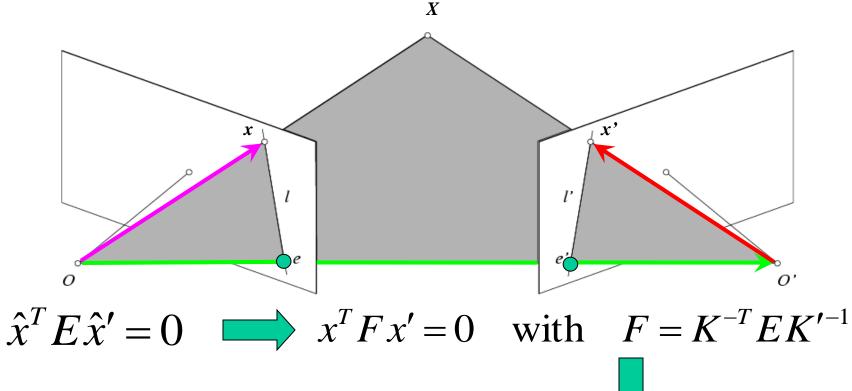

- The calibration matrices K and K' of the two cameras are unknown
- We can write the epipolar constraint in terms of unknown normalized coordinates:

$$\hat{x}^T E \hat{x}' = 0 \qquad x = K$$

$$x = K\hat{x}, \quad x' = K'\hat{x}'$$

#### Recap: Epipolar Geometry - Uncalibrated Case

$$x = K\hat{x}$$

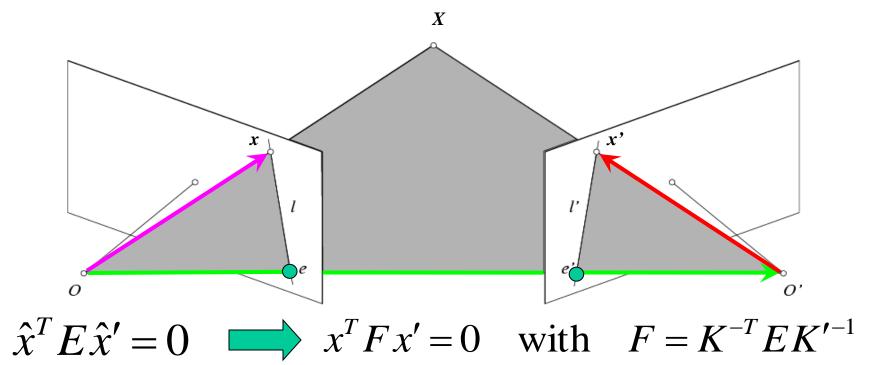

$$x' = K'\hat{x}'$$

**Fundamental Matrix** (Faugeras and Luong, 1992)

#### RWTHAACHEN UNIVERSITY

#### Recap: Epipolar Geometry - Uncalibrated Case

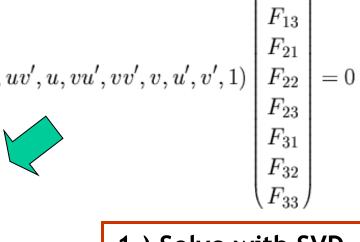

- F x' is the epipolar line associated with x' (l = F x')
- $F^Tx$  is the epipolar line associated with x  $(l' = F^Tx)$
- F e' = 0 and  $F^{T}e = 0$
- F is singular (rank two)
- F has seven degrees of freedom

B. Leibe

## Recap: The Eight-Point Algorithm

$$x = (u, v, 1)^T, x' = (u', v', 1)^T$$

$$\begin{bmatrix} u_{1}u'_{1} & u_{1}v'_{1} & u_{1} & v_{1}u'_{1} & v_{1}v'_{1} & v_{1} & u'_{1} & v'_{1} & 1 \\ u_{2}u'_{2} & u_{2}v'_{2} & u_{2} & v_{2}u'_{2} & v_{2}v'_{2} & v_{2} & u'_{2} & v'_{2} & 1 \\ u_{3}u'_{3} & u_{3}v'_{3} & u_{3} & v_{3}u'_{3} & v_{3}v'_{3} & v_{3} & u'_{3} & v'_{3} & 1 \\ u_{4}u'_{4} & u_{4}v'_{4} & u_{4} & v_{4}u'_{4} & v_{4}v'_{4} & v_{4} & u'_{4} & v'_{4} & 1 \\ u_{5}u'_{5} & u_{5}v'_{5} & u_{5} & v_{5}u'_{5} & v_{5}v'_{5} & v_{5} & u'_{5} & v'_{5} & 1 \\ u_{6}u'_{6} & u_{6}v'_{6} & u_{6} & v_{6}u'_{6} & v_{6}v'_{6} & v_{6} & u'_{6} & v'_{6} & 1 \\ u_{7}u'_{7} & u_{7}v'_{7} & u_{7} & v_{7}u'_{7} & v_{7}v'_{7} & v_{7} & u'_{7} & v'_{7} & 1 \\ u_{8}u'_{8} & u_{8}v'_{8} & u_{8} & v_{8}u'_{8} & v_{8}v'_{8} & v_{8} & u'_{8} & v'_{8} & 1 \end{bmatrix} \begin{bmatrix} F_{11} \\ F_{12} \\ F_{13} \\ F_{21} \\ F_{22} \\ F_{23} \\ F_{31} \\ F_{32} \\ F_{33} \end{bmatrix}$$

# 1.) Solve with SVD. This minimizes

$$\sum_{i=1}^{N} (x_i^T F x_i')^2$$

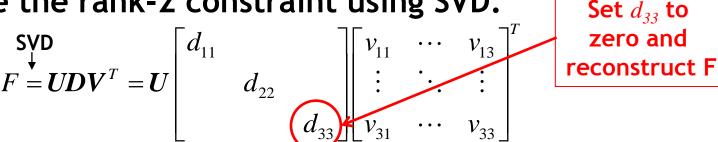

2.) Enfore rank-2 constraint using SVD

Problem: poor numerical conditioning

B. Leibe

### Recap: Normalized Eight-Point Alg.

- Exercise 6.11
- 1. Center the image data at the origin, and scale it so the mean squared distance between the origin and the data points is 2 pixels.
- 2. Use the eight-point algorithm to compute *F* from the normalized points.
- 3. Enforce the rank-2 constraint using SVD.

4. Transform fundamental matrix back to original units: if T and T' are the normalizing transformations in the two images, than the fundamental matrix in original coordinates is  $T^T F T'$ .

B. Leibe

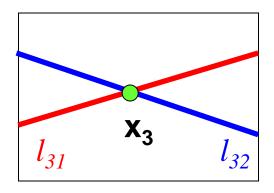

### Recap: Epipolar Transfer

- Assume the epipolar geometry is known
- Given projections of the same point in two images, how can we compute the projection of that point in a third image?

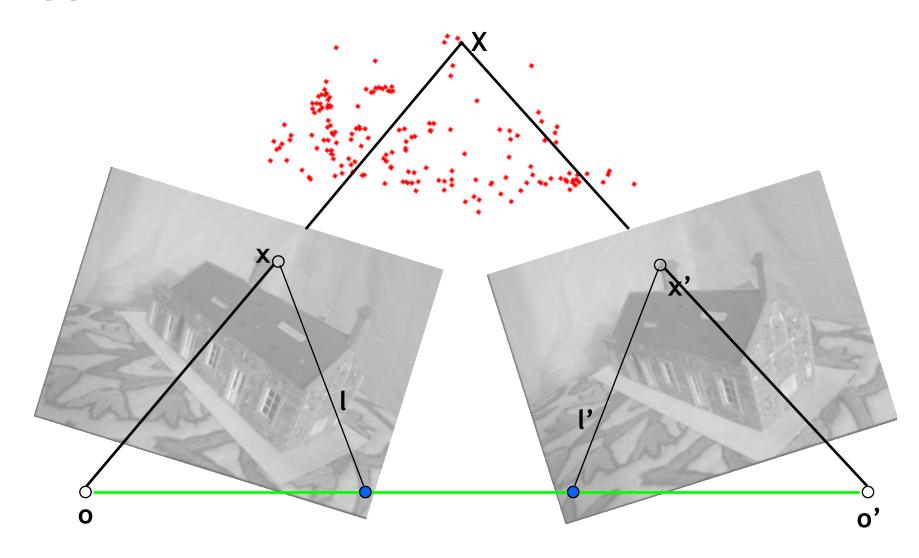

$$l_{31} = F^{T}_{13} x_{1}$$
$$l_{32} = F^{T}_{23} x_{2}$$

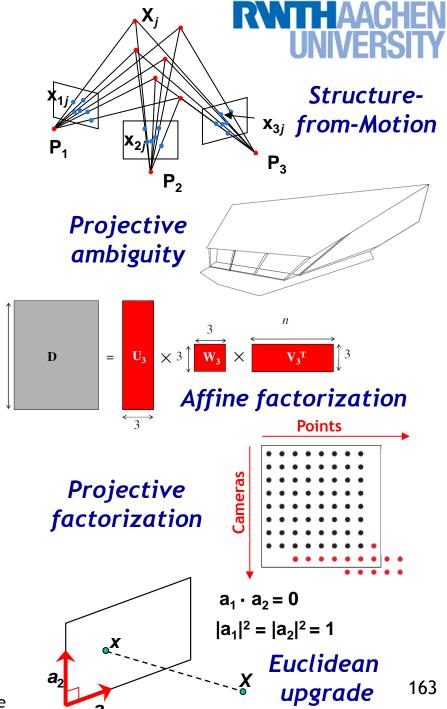

## **Applications: 3D Reconstruction**

### Repetition

- Object Categorization
- 3D Reconstruction
  - Epipolar Geometry and Stereo Basics
  - Camera Calibration & Uncalibrated Reconstruction
  - > Structure-from-Motion
- Motion and Tracking

B. Leibe

#### Recap: Structure from Motion

• Given: *m* images of *n* fixed 3D points

$$x_{ij} = P_i X_j, \quad i = 1, ..., m, \quad j = 1, ..., n$$

• Problem: estimate m projection matrices  $P_i$  and n 3D points  $X_j$  from the mn correspondences  $x_{ij}$ 

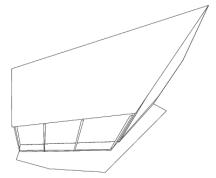

#### RWTHAACHEN UNIVERSITY

### Recap: Structure from Motion Ambiguity

- If we scale the entire scene by some factor k and, at the same time, scale the camera matrices by the factor of 1/k, the projections of the scene points in the image remain exactly the same.
- More generally: if we transform the scene using a transformation  $\mathbf{Q}$  and apply the inverse transformation to the camera matrices, then the images do not change

$$\mathbf{x} = \mathbf{P}\mathbf{X} = (\mathbf{P}\mathbf{Q}^{-1})\mathbf{Q}\mathbf{X}$$

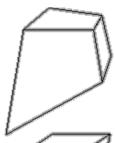

B. Leibe

## Recap: Hierarchy of 3D Transformations

Projective  $\begin{bmatrix} A & t \\ 15dof & v^T & v \end{bmatrix}$ 

$$\begin{bmatrix} A & t \\ v^{\mathsf{T}} & v \end{bmatrix}$$

**Preserves intersection** and tangency

Affine 12dof

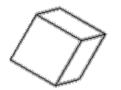

$$\begin{bmatrix} A & t \\ 0^{\mathsf{T}} & 1 \end{bmatrix}$$

Preserves parallellism, volume ratios

Similarity 7dof

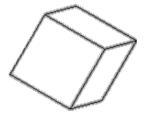

$$\begin{bmatrix} s \mathbf{R} & \mathbf{t} \\ 0^{\mathsf{T}} & 1 \end{bmatrix}$$

Preserves angles, ratios of length

Euclidean 6dof

$$\begin{bmatrix} R & t \\ 0^T & 1 \end{bmatrix}$$

Preserves angles, lengths

- With no constraints on the camera calibration matrix or on the scene, we get a projective reconstruction.
- Need additional information to *upgrade* the reconstruction to affine, similarity, or Euclidean.

Slide credit: Svetlana Lazebnik

### Recap: Affine Structure from Motion

• Let's create a 2m × n data (measurement) matrix:

$$\mathbf{D} = \begin{bmatrix} \hat{\mathbf{x}}_{11} & \hat{\mathbf{x}}_{12} & \cdots & \hat{\mathbf{x}}_{1n} \\ \hat{\mathbf{x}}_{21} & \hat{\mathbf{x}}_{22} & \cdots & \hat{\mathbf{x}}_{2n} \\ \vdots & \vdots & \vdots \\ \hat{\mathbf{x}}_{m1} & \hat{\mathbf{x}}_{m2} & \cdots & \hat{\mathbf{x}}_{mn} \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_2 \\ \vdots \\ \mathbf{A}_m \end{bmatrix} \begin{bmatrix} \mathbf{X}_1 & \mathbf{X}_2 & \cdots & \mathbf{X}_n \end{bmatrix}$$

Cameras  $(2m \times 3)$ 

• The measurement matrix D = MS must have rank 3!

C. Tomasi and T. Kanade. Shape and motion from image streams under orthography: A factorization method. IJCV, 9(2):137-154, November 1992.

### **Recap: Affine Factorization**

Obtaining a factorization from SVD:

Slide credit: Martial Hebert

### Recap: Projective Factorization

$$\mathbf{D} = \begin{bmatrix} z_{11}\mathbf{X}_{11} & z_{12}\mathbf{X}_{12} & \cdots & z_{1n}\mathbf{X}_{1n} \\ z_{21}\mathbf{X}_{21} & z_{22}\mathbf{X}_{22} & \cdots & z_{2n}\mathbf{X}_{2n} \\ \vdots & \vdots & \vdots \\ z_{m1}\mathbf{X}_{m1} & z_{m2}\mathbf{X}_{m2} & \cdots & z_{mn}\mathbf{X}_{mn} \end{bmatrix} = \begin{bmatrix} \mathbf{P}_1 \\ \mathbf{P}_2 \\ \vdots \\ \mathbf{P}_m \end{bmatrix} \begin{bmatrix} \mathbf{X}_1 & \mathbf{X}_2 & \cdots & \mathbf{X}_n \end{bmatrix}$$
Cameras
$$(3 \, m \times 4)$$

D = MS has rank 4

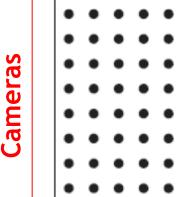

- If we knew the depths z, we could factorize D to estimate M and S.
- If we knew M and S, we could solve for z.
- Solution: iterative approach (alternate between above two steps).

169

### Recap: Sequential Projective SfM

- Initialize motion from two images using fundamental matrix
- Initialize structure
- For each additional view:
  - Determine projection matrix of new camera using all the known 3D points that are visible in its image calibration
  - Refine and extend structure: compute new 3D points, re-optimize existing points that are also seen by this camera triangulation
- Refine structure and motion: bundle adjustment

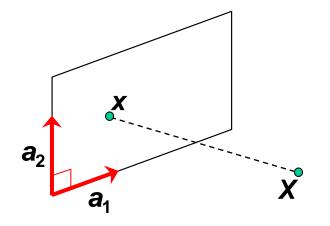

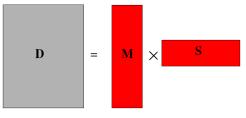

**Points** 

## Recap: Estimating the Euclidean Upgrade

- Goal: Estimate ambiguity matrix C
  - Orthographic assumption:

 $M \rightarrow MC$ ,  $S \rightarrow C^{-1}S$ 

- 1) Image axes are perpendicular  $a_1 \cdot a_2 = 0$
- 2) Scale is 1  $|a_1|^2 = |a_2|^2 = 1$
- This can be converted into a system of 3m equations:

$$\begin{cases} \hat{a}_{i1} \cdot \hat{a}_{i2} = 0 \\ |\hat{a}_{i1}| = 1 \\ |\hat{a}_{i2}| = 1 \end{cases} \Leftrightarrow \begin{cases} a_{i1}^T C C^T a_{i2} = 0 \\ a_{i1}^T C C^T a_{i1} = 1, \quad i = 1, ..., m \\ a_{i2}^T C C^T a_{i2} = 1 \end{cases}$$

with  $L = CC^T$ this translates to

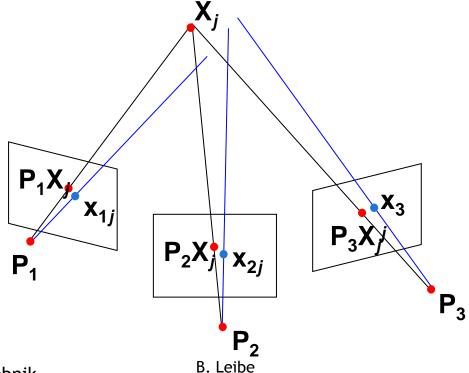

$$A_i L A_i^T = I$$

### Recap: Bundle Adjustment

- Non-linear method for refining structure and motion
- Minimizing mean-square reprojection error

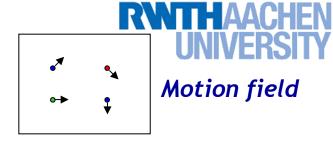

$$E(\mathbf{P}, \mathbf{X}) = \sum_{i=1}^{m} \sum_{j=1}^{n} D(\mathbf{x}_{ij}, \mathbf{P}_i \mathbf{X}_j)^2$$

  - Motion and Optical Flow

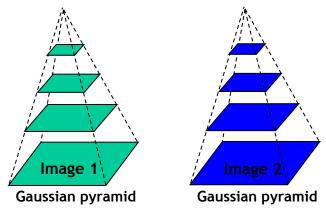

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

$$A^T A$$

$$A^T b$$

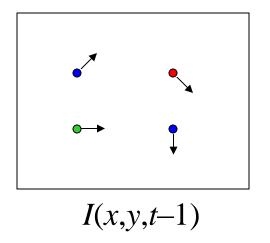

Lucas-Kanade optical flow

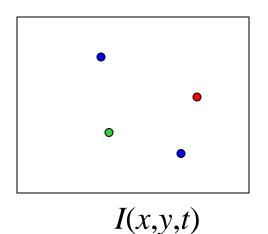

Coarse-to-fine estimation

### Recap: Estimating Optical Flow

- Given two subsequent frames, estimate the apparent motion field u(x,y) and v(x,y) between them.
- Key assumptions
  - Brightness constancy: projection of the same point looks the same in every frame.
  - Small motion: points do not move very far.
  - > Spatial coherence: points move like their neighbors.

## Recap: Lucas-Kanade Optical Flow

- Use all pixels in a K×K window to get more equations.
- Least squares problem:

$$\begin{bmatrix} I_{x}(\mathbf{p}_{1}) & I_{y}(\mathbf{p}_{1}) \\ I_{x}(\mathbf{p}_{2}) & I_{y}(\mathbf{p}_{2}) \\ \vdots & \vdots \\ I_{x}(\mathbf{p}_{25}) & I_{y}(\mathbf{p}_{25}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{t}(\mathbf{p}_{1}) \\ I_{t}(\mathbf{p}_{2}) \\ \vdots \\ I_{t}(\mathbf{p}_{25}) \end{bmatrix} A d = b$$
25x2 2x1 25x1

Minimum least squares solution given by solution of

$$(A^T A) d = A^T b$$

$$2 \times 2 \times 1 \qquad 2 \times 1$$

Recall the Harris detector!

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

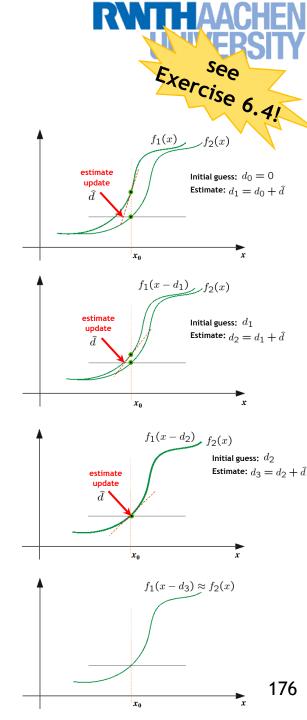

$$A^T A$$

$$A^T b$$

175

### Recap: Iterative Refinement

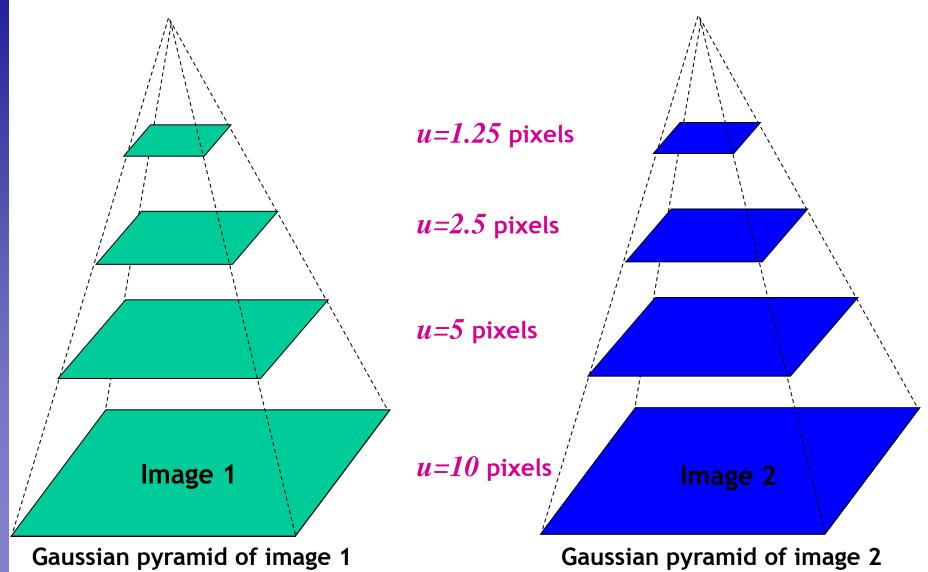

- Estimate velocity at each pixel using one iteration of LK estimation.
- Warp one image toward the other using the estimated flow field.
- Refine estimate by repeating the process.
- Iterative procedure
  - > Results in subpixel accurate localization.
  - Converges for small displacements.
