

Machine Learning – Lecture 15

Convolutional Neural Networks III

10.01.2019

Bastian Leibe RWTH Aachen http://www.vision.rwth-aachen.de

leibe@vision.rwth-aachen.de

RWTHAACHEN UNIVERSITY

Course Outline

- Fundamentals
 - Bayes Decision Theory
 - Probability Density Estimation
- Classification Approaches
 - Linear Discriminants
 - Support Vector Machines
 - Ensemble Methods & Boosting
 - Random Forests
- Deep Learning
 - Foundations
 - Convolutional Neural Networks
 - Recurrent Neural Networks

4

Topics of This Lecture

- Recap: CNN Architectures
- Residual Networks
 - Detailed analysis
 - ResNets as ensembles of shallow networks
- Applications of CNNs
 - Object detection
 - Semantic segmentation
 - Face identification

Recap: Convolutional Neural Networks

- Neural network with specialized connectivity structure
 - Stack multiple stages of feature extractors
 - Higher stages compute more global, more invariant features
 - Classification layer at the end

Y. LeCun, L. Bottou, Y. Bengio, and P. Haffner, <u>Gradient-based learning applied to</u> <u>document recognition</u>, Proceedings of the IEEE 86(11): 2278–2324, 1998.

Machine Learning Winter '18

RWTHAACHEN UNIVERSITY

6

Recap: AlexNet (2012)

- Similar framework as LeNet, but
 - Bigger model (7 hidden layers, 650k units, 60M parameters)
 - More data (10⁶ images instead of 10³)
 - > GPU implementation
 - Better regularization and up-to-date tricks for training (Dropout)

A. Krizhevsky, I. Sutskever, and G. Hinton, <u>ImageNet Classification with Deep</u> <u>Convolutional Neural Networks</u>, NIPS 2012.

Recap: VGGNet (2014/15)

- Main ideas
 - Deeper network
 - Stacked convolutional layers with smaller filters (+ nonlinearity)
 - Detailed evaluation of all components

Results

Improved ILSVRC top-5 error rate to 6.7%.

Recap: GoogLeNet (2014)

- Ideas:
 - Learn features at multiple scales

(b) Inception module with dimension reductions

8

Recap: Visualizing CNNs

Feature visualization of convolutional net trained on ImageNet from [Zeiler & Fergus 2013]

Topics of This Lecture

- Recap: CNN Architectures
- Residual Networks
 - Detailed analysis
 - ResNets as ensembles of shallow networks
- Applications of CNNs
 - > Object detection
 - Semantic segmentation
 - Face identification

Recap: Residual Networks

RWTHAACHEN UNIVERSITY

Spectrum of Depth

Spectrum of Depth

- Deeper models are more powerful
 - > But training them is harder.
 - > Main problem: getting the gradients back to the early layers
 - > The deeper the network, the more effort is required for this.

Initialization

- Importance of proper initialization (Recall Lecture 12)
 - Glorot initialization for tanh nonlinearities \triangleright
 - He initialization for ReLU nonlinearities \triangleright
 - \Rightarrow For deep networks, this really makes a difference!

RWTHAACHEN UNIVERSITY

Batch Normalization

- Effect of batch normalization
 - Greatly improved speed of convergence
 - > Often better accuracy achievable

Going Deeper

- Checklist
 - Initialization ok
 - Batch normalization ok
 - > Are we now set?
 - Is learning better networks now as simple as stacking more layers?

00

1

2

3

iter. (1e4)

Experiment going deeper

4

5

- Plain nets: stacking 3×3 convolution layers
- \Rightarrow 56-layer net has higher training error than 20-layer net

20-layer

0

3

iter. (1e4)

4

5

6

20-laver

RWTHAACHEN UNIVERSITY

Simply Stacking Layers?

General observation

- > Overly deep networks have higher training error
- A general phenomenon, observed in many training sets

Why Is That???

- A deeper model should not have higher training error!
 - Richer solution space should allow it to find better solutions
- Solution by construction
 - Copy the original layers from a learned shallower model
 - Set the extra layers as identity
 - Such a network should achieve at least the same low training error.
- Reason: Optimization difficulties
 - Solvers cannot find the solution when going deeper...

Machine Learning Winter '18

Deep Residual Learning

Plain net

- H(x) is any desired mapping
- > Hope the 2 weight layers fit H(x)

Deep Residual Learning

Residual net

- > H(x) is any desired mapping
- Hope the 2 weight layers fit H(x)
- > Hope the 2 weight layers fit F(x)Let H(x) = F(x) + x

Deep Residual Learning

• F(x) is a residual mapping w.r.t. identity

- If identity were optimal, it is easy to set weights as 0
- If optimal mapping is closer to identity, it is easier to find small fluctuations
- Further advantage: direct path for the gradient to flow to the previous stages

Network Design

- Simple, VGG-style design
 - Almost) all 3×3 convolutions
 - Spatial size /2 ⇒ #filters · 2 (same complexity per layer)
 - Batch normalization
 - \Rightarrow Simple design, just deep.

ImageNet Performance

Machine Learning Winter '18

B. Leibe

PASCAL VOC Object Detection Performance

B. Leibe

Topics of This Lecture

- Recap: CNN Architectures
- Residual Networks
 - Detailed analysis
 - ResNets as ensembles of shallow networks
- Applications of CNNs
 - > Object detection
 - Semantic segmentation
 - Face identification

What Is The Secret Behind ResNets?

- Empirically, they perform very well, but why is that?
- He's original explanation

 \succ

 \geq

- ResNets allow gradients to pass through the skip connections in unchanged form.
- > This makes it possible to effectively train deeper networks.
- \Rightarrow Secret of success: depth is good
- More recent explanation
 - . ResNets actually do not use deep network paths.
 - Instead, they effectively implement an ensemble of shallow network paths.
 - \Rightarrow Secret of success: ensembles are good

A, Veit, M. Wilber, S. Belongie, <u>Residual Networks Behave Like Ensembles</u> of Relatively Shallow Networks, NIPS 2016

29

[He, 2016]

[Veit, 2016]

Idea of the Analysis

Effect of deleting layer f_2

- Unraveling ResNets
 - ResNets can be viewed as a collection of shorter paths through different subsets of the layers.
 - > Deleting a layer corresponds to removing only some of those paths

Effect of Deleting Layers at Test Time

- Experiments on ImageNet classification
 - When deleting a layer in VGG-Net, it breaks down completely.
 - In ResNets, deleting a single layer has almost no effect (except for the pooling layers)
 - > Deleting an increasing number of layers increases the error smoothly
 - \Rightarrow Paths in a ResNet do not strongly depend on each other.

Which Paths Are Important?

- How much does each of the paths contribute?
 - Distribution of path lengths follows a Binomial distribution
 - Sample individual paths and measure their gradient magnitude
 - \Rightarrow Effectively, only shallow paths with 5-17 modules are used!
 - \Rightarrow This corresponds to only 0.45% of the available paths here.

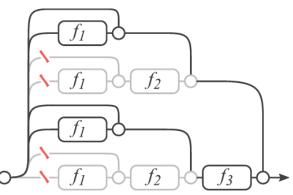

32

Summary

- The effective paths in ResNets are relatively shallow
 - Effectively only 5-17 active modules
- This explains the resilience to deletion
 - Deleting any single layer only affects a subset of paths (and the shorter ones less than the longer ones).
 - New interpretation of ResNets
 - ResNets work by creating an ensemble of relatively shallow paths
 - Making ResNets deeper increases the size of this ensemble
 - Excluding longer paths from training does not negatively affect the results.

33

Image source: Veit et al., 2016

RWTHAACHEN UNIVERSITY

Topics of This Lecture

- Recap: CNN Architectures
- Residual Networks
 - > Detailed analysis
 - ResNets as ensembles of shallow networks

Applications of CNNs

- Object detection
- Semantic segmentation
- Face identification

- Experiment: feature transfer
 - Train AlexNet-like network on ImageNet
 - > Chop off last layer and train classification layer on CalTech256
 - \Rightarrow State of the art accuracy already with only 6 training images!

 ∞

Transfer Learning with CNNs

| Image | |
|----------|---|
| conv-64 | 1 |
| maxpool | 1 |
| conv-128 | |
| conv-128 | |
| maxpool | |
| conv-256 |] |
| conv-256 |] |
| maxpool | |
| conv-512 | 1 |
| conv-512 | |
| maxpool | |
| conv-512 | |
| conv-512 | |
| maxpool | |
| FC-4096 | 1 |
| FC-4096 | |
| FC-1000 | |
| softmax | |

2. If small dataset: fix all weights (treat CNN as fixed feature extractor), retrain only the classifier

I.e., swap the Softmax layer at the end

Transfer Learning with CNNs

| 1. Train on ImageNet | | |
|-------------------------|---|--|
| | | |
| | | |
| | ſ | |
| | | |

3. If you have medium sized dataset,
"finetune" instead: use the old weights as initialization, train the full network or only some of the higher layers.

Retrain bigger portion of the network

Other Tasks: Detection

R-CNN: Regions with CNN features

- Results on PASCAL VOC Detection benchmark
 - Pre-CNN state of the art: 35.1% mAP [Uijlings et al., 2013]
 33.4% mAP DPM
 R-CNN: 53.7% mAP

Machine Learning Winter '18

Mask R-CNN Results

Detection + Instance segmentation

Detection + Pose estimation

YOLO / SSD

Input image 3 x H x W

Divide image into grid 7 x 7

- Idea: Directly go from image to detection scores
- Within each grid cell
 - Start from a set of anchor boxes
 - Regress from each of the B anchor boxes to a final box
 - > Predict scores for each of C classes (including background)

YOLO

Machine Learning Winter '18

J. Redmon, S. Divvala, R. Girshick, A. Farhadi, <u>You Only Look Once: Unified,</u> <u>Real-Time Object Detection</u>, CVPR 2016.

Object Detection Performance

Semantic Image Segmentation

- Perform pixel-wise prediction task
 - > Usually done using Fully Convolutional Networks (FCNs)
 - All operations formulated as convolutions
 - Advantage: can process arbitrarily sized images

CNNs vs. FCNs

CNN

256 256

- Intuition
 - Think of FCNs as performing a sliding-window classification, producing a heatmap of output scores for each class

Semantic Image Segmentation

- **Encoder-Decoder Architecture**
 - Problem: FCN output has low resolution
 - Solution: perform upsampling to get back to desired resolution
 - > Use skip connections to preserve higher-resolution information

RWTHAACHEN UNIVERSITY

Semantic Segmentation

- Current state-of-the-art
 - Based on an extension of ResNets

[Pohlen, Hermans, Mathias, Leibe, CVPR 2017]

Other Tasks: Face Identification

Level Performance in Face Verification, CVPR 2014

Slide credit: Svetlana Lazebnik

Machine Learning Winter '18

Learning Similarity Functions

Siamese Network

- Present the two stimuli to two identical copies of a network (with shared parameters)
- Train them to output similar values if the inputs are (semantically) similar.
- Used for many matching tasks
 - Face identification
 - Stereo estimation
 - Optical flow

• • • •

Extension: Triplet Loss Networks

- Learning a discriminative embedding
 - Present the network with triplets of examples

Positive

> Apply triplet loss to learn an embedding $f(\cdot)$ that groups the positive example closer to the anchor than the negative one.

 \Rightarrow Used with great success in Google's FaceNet face identification
